Dayton Computing Scales are known the world over as the best for money.
International Time Recorders are used in almost every progressive plant in existence.
Hollerith Tabulating and Recording Machines are recognized as one of the great machines of the age—mechanically classifying and sorting records in any conceivable way desired.
Our combined users are numbered in hundreds of thousands in every kind of business known.
Our \$2,000,000 capitalization in these times surely indicates our faith in Canada.

Drillmen Like the DR-6— — because it runs

in true balance; while its small front head, absence of projecting valve chest, and hand chuck locking ring make steel changes quick and easy. The single-handle throttle control for the supply of air and water is a feature of operating convenience.

The "DR-6" is 2 1/2 inches in cylinder diameter, uses hollow steel and drills to a depth of 10 to 16 feet.

Leading "DR-6" features include : Hard

blow powerful rotation, combined air and water hole cleaning jet, all steel construction. Important "DR-6" results include : High drilling speed, low repair costs, small steel breakage.

As drilling engineers, and manufacturers of a wide range of drilling machines, we recommend the "DR-6" water drill for drifting, tunneling and general mining work of the heavier kind, in which a powerful, rapid cutting, substantial drill is needed.

Do the work
the Leyner
way

THE LEYNER "JACKSTEEL" SHARPENER

This type of sharpener has been designed to take care of the smaller sizes of steel, such as are used with "Jackhammers," "Stopehammers" and Plug Drills.

This machine will be found a paying investment by the small mine or quarry, or on contract work, where two or more drills of any of the types mentioned above are used, when the range of steel comes within the capacity of this style of sharpener, as is generally the case.

Bulletin 4037 describes the "Jacksteel" Sharpener. Bulletin 4122 describes our regular No. 5 Sharpener. Bulletin 4039 describes the Leyner Shank and Bit Punch.

Let us send you copies of any of these.

We build Air and Gas Compressors, Rock Drills, Coal Cutters, Pneumatic Tools, Air Hoists and Air Power Machinery of all kinds. Estimates and full information promptly furnished.

FARREL-BACON CRUSHER

These crushers are the original Bacon design, which is an improvement on the old-type crusher. The construction is massive, metal being well distributed. The pitman is of cast steel of patented construction, and other parts are of chilled iron or steel, as the service requires. These crushers are built in sizes 10 x 7 receiving opening to largest sizes.

FLOAT FEED

... Carbide ... Mine Lamps

Work Without Watching

The Float Feed lifts once every 90 seconds—the total lift is 1½ inches and it takes 6 hours for the feed to make the complete lift. This explanation makes it easy to understand how slight each lift must be. The Float Feed does what hand regulation is supposed to do, but the raking is done at just the right moment and never vigorously. Results—never any excess generation and no gas wasted.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Canadian Milk Products Co. Ltd.,
Toronto, Ont.

Gentlemen:—

I have recently been living in Canada at a mining camp where it was impossible to obtain fresh milk, and I used your "Klim" with most satisfactory results. I am now living in the United States, and owing to the present high price of fresh milk, I would like very much to continue the use of "Klim" for cooking purposes. I would be very much obliged if you would let me know whether or not it is possible to obtain "Klim" in the United States and if so I would like to know your nearest agent.

Hoping for a favorable reply, I am,

Very truly yours,
Mrs. _____

Ask your Supply House about KLIM. You will find it the most economical and satisfactory milk for use in camps or on prospecting trips.

FLOTATION PATENTS.

Aside from the suspicion of German control it is questionable whether the Minerals Separation patents are now of any great value in Canada. In our issue of Oct. 15, we pointed out that Canadian laws allow only a reasonable royalty and that the Minerals Separation corporations can hardly expect to be as successful in Canadian courts as in United States courts. We stated that if the American corporation threatens Canadian users of the process with claims for excessive amounts it must be only bluffing. It is provided under Section 44 of the Canadian Patent Act that in case a patentee refuses to grant licenses to others on reasonable terms, anyone may apply to the Commissioner of Patents for a license to make, use or sell the patented invention. As the claims of the Minerals Separation corporation and the conditions under which it issues licenses are unreasonable, it is obvious that Canadian Mining companies have good reason to assume that an application

THE REPORT ON IRON ORE OCCURRENCES.

We have just received from the Department of Mines the first volume of a report on "Iron Ore Occurrences in Canada." The report is a timely one, for there has seldom been so good a demand for iron ore as at present. Many enquiries concerning Canadian deposits are being made, and this description of the principal iron ore mines, few of which are now being worked, will help to answer questions that are being asked. The report was compiled by E. Lindeman and L. L. Bolton. The introductory chapter was written by A. H. A. Robinson.

Unfortunately, there has been great waste in the printing of this report, as in other reports printed in the Government Printing Bureau. Some time ago we referred to the waste of paper in reports of the Mines Branch. In this little book of 90 pages, 30 is pure waste. There is only 60 pages of printed matter and the book is padded out by 30 blank pages. Moreover, some of the photographs, such as III, are so poor that we wonder why they were used at all. Others, such as X, that contain objects of interest have not been properly used. If the useless photographs had been discarded and only those parts of the others that illustrate the text used, there would have been even less than 60 pages needed. Moreover, increased usefulness as well as saving in space would have been obtained by running the illustrations with the text.

THE RESOURCES COMMISSION.

In his letter addressed to the editor of the Bulletin of the Canadian Mining Institute, Mr. Geo. Mackenzie asks a question concerning our criticism of the circular sent out by the Munition Resources Commission.

Mr. Mackenzie wants to know to what end we are making argument. He is entitled to a frank reply and we will endeavor to be brief.

We believe that the work undertaken by the Munition Resources Commission could best be performed by a committee composed of representatives of the Federal and Provincial mining departments and the Canadian Mining Institute. We believe that the Commission, except along certain lines, is out of touch with the work of these departments, is poorly informed concerning our known deposits, and is not the proper organization to gather information. The Commission, if it wishes, might have a representative on a War Minerals Committee, but it should not undertake to itself act as the committee. Mr. Mackenzie would be a valuable man on such a committee, as the representative of the Commission or the Mines Branch. We believe further that we have all the necessary machinery for gathering information concerning our mineral resources and that it decreases rather than increases the efficiency of the machinery to have Commissions, such as the Munition Resources Commission, undertaking to do work which has been or can be better done by the

The Work of the Geological Survey

At the last meeting of the Western Branch of the Canadian Mining Institute, which was held at Princeton, Similkameen, B.C., Mr. Charles Camsell, of the Geological Survey of Canada, said:

"I am pleased to be present at this meeting of the Western Branch of the Canadian Mining Institute, as it gives me a good opportunity to get into touch with mining men who are operating in various parts of the Province of British Columbia.

"The chief function of the Geological Survey of Canada is to assist as much as possible in the development of the material resources of the country, and since it is impossible for Survey officials to visit all parts of the country to determine what is required in the way of survey work, meetings such as this one afford excellent opportunities for acquiring that knowledge, so that we can best adjust and co-ordinate the work of the Survey to meet the needs of the mining industry.

"The territory over which I now have general supervision is very large and comprises, besides unexplored Northern Canada, the whole of British Columbia and Yukon Territory, the increase in responsibility being due to the recent death of Dr. D. D. Cairnes, who had charge of the work in the Yukon, and of Mr. O. E. LeRoy, killed lately in France, who had been in charge of the work in British Columbia. It will be seen, therefore, that under ordinary conditions it is well nigh impossible to keep closely in touch with the requirements of all parts of these extensive regions. I may add that for the time exploration work has been abandoned, but there still remains a large area and much work to be supervised.

"It is my desire to take advantage of this opportunity of outlining to you the amount and character of the work the Geological Survey has been doing, in order to meet certain criticism of our not having done enough, or, again, of having done too much. It must be remembered that our country is very large, while our appropriation for field work is comparatively small, for it is not as large as that of the United States Geological Survey for Alaska alone. But even if we had a larger grant, we could not at the present time use it advantageously, because we have not on the Survey staff a sufficient number of properly trained men. Our losses from death or through enlistment in war service have been high in proportion to the numerical strength of our staff. British Columbia and Yukon Territory have suffered most in these respects, for out of about seven geologists who used to work in this western part of Canada, three have gone to the front (and of these one has been killed), and, within the last year, two others have died. Among the topographers the proportion of enlistments has been even higher. In other parts of the Dominion we have had losses also by enlistments, and since these men cannot at present be replaced, the work of the Survey has had to be curtailed proportionately. It is, therefore, self-evident why we cannot now place as many men in the western field for geological and topographical work as in past years.

"To meet the other objection, namely, that we are doing too much, or not the right kind of work, I ask you to look at the programme of the Survey for last

field, all of whom were engaged in purely economic work, with a view to increasing the production of various kinds of minerals. Some of the members of our staff were doing special work, and others were engaged in making particular investigations in connection with materials required in the conduct of the war. In Eastern Canada investigations were made on deposits of gold, copper, molybdenite, iron ore, magnesite, petroleum, and other minerals. In Manitoba, the new gold and copper fields near the Hudson Bay Railway were examined, and some classification of the land, according to its agricultural value, was made in the northern part of that province. In various parts of the Dominion road materials were classified and mapped. In Alberta and Saskatchewan, gas and coal fields were examined in the southern parts, while in the northern parts work was carried on to determine what are the possibilities for the occurrence there of oil. In British Columbia and Yukon Territory there were six parties, all engaged in purely economic work.

"In several instances results of considerable value to the mining industry have been obtained, which certainly justified the expense of the work. It is gratifying to know that on the whole mining men are very appreciative of the work the officials of the Survey do, and it is their criticism that we do not do enough, probably meaning thereby enough in the parts of the country in which they are particularly interested. They must remember however, that we cannot supply every demand. We have to look at the situation in the light of the needs of the country as a whole, and, accordingly, arrange to do our work where the greatest good will be done to the greatest number of people."

Mr. Camsell then spoke of his own work in the Coast range, of British Columbia, along the line of the Pacific Great Eastern railway. That region had been assumed to be composed entirely of granite, but investigation had shown that on the Pacific Great Eastern section there are several belts of sedimentary rocks running parallel to the range and intruded by granite. The contacts of these belts with the granite are all more or less mineralized, chiefly by copper, and some of them give promise of being found to contain ore deposits of commercial importance. The significant feature of the results obtained along the Pacific Great Eastern railway is that what had been assumed to be a large area of granite nearly one hundred miles wide and several hundred miles long without any mineral deposits of commercial value may be proved to contain several important belts of sedimentary rocks throughout the length of the range in which the conditions necessary for the presence of deposits of gold, copper, silver, lead, zinc, etc., are favorable.

He next drew attention to the great length of coast line bordering the Coast range and which for purposes of transportation is as good as a railway line, and he strongly recommended prospecting along the coast. He also mentioned the necessity for more intensive prospecting along lines of railway where, by reason of favorable location, comparatively low-grade deposits of mineral could be turned to profitable account. In

Another suggestion he made to prospectors was that they should search not only for deposits of metallic minerals, but as well for non-metallic minerals. The latter are too generally overlooked by both prospectors and engineers, but they form a large proportion of the mineral wealth of the country. Such deposits as mica, feldspar, silica, potash, bauxite, magnesite, brick-clays, phosphate-rock, abrasives, cement materials, and various others are all well worth being on the look-out for.

In closing, he expressed his gratification at the progress being made in the development of the copper deposits of Copper Mountain, Similkameen, a progress made in spite of enormous difficulties and due entirely to the faith and persistence of the men in charge of the development work. The future of the Copper Mountain mines now seemed assured. Finally, he expressed his heartfelt thanks to the people of Princeton and surrounding district for their kindly welcome on his return to what had been his field of work for several years.

Dr. W. F. Ferrier, of Toronto, also emphasized the advisability of prospecting for non-metallic minerals, many of which are now in demand for war purposes. He drew particular attention to the possibility of the occurrence of bauxite, a hydrous oxide of alumina, in British Columbia, especially in the Interior Plateau region, where the basaltic rocks, similar to those from the alteration of which the bauxites of some foreign localities have been derived, are widely distributed.

The different forms of this mineral, their composition, modes of occurrence, and uses were described, and some specimens of bauxite were exhibited. Some of the theories advanced regarding its derivation from various types of rocks were briefly outlined.

Attention was also called to the fact that bauxite is used not only as an ore of aluminum and in the production of many chemicals, but also, is in demand for the manufacture of artificial abrasives employed in the finishing of guns, cartridge cases, motors, and other war material.

INTERNATIONAL PETROLEUM COMPANY.

At the annual meeting of the International Petroleum Company, Limited, held at Toronto on Dec. 10th, Walter C. Teagle, owing to his recent election to the Presidency of the Standard Oil Company of New Jersey, retired from the board. The following were elected Directors for the ensuing year: G. H. Smith, Hon. W. J. Hanna, J. L. Englehart, Capt. Henry Keswick, Hon. Wallace Nesbitt, Sir Edmund Osler, C. O. Stillman and A. M. McQueen.

G. H. Smith, formerly Vice-President, was elected President. The Hon. W. J. Hanna and A. M. McQueen were elected Vice-Presidents of the company. J. R. Clarke was appointed Secretary and Treasurer, and H. W. Chapin, Assistant Secretary and Treasurer.

The Directors declared a dividend of fifty cents per share, payable on or before the 31st of January, 1918. Payment of this dividend will be advertised later.

The Granby News, issued for the information of the Granby Consolidated Company's employees in various parts of British Columbia and Alaska, stated in its November number that there were 815 men on the company's Anyox smelter payroll on October 22, exclusive of all office, store, engineering, messhouse

CANADA'S MINERAL RESOURCES.

Some outstanding facts concerning Canada's mineral resources were pointed out by Mr. A. A. Cole, president of the Canadian Mining Institute in an address before the Canadian Club of Montreal some months ago. Mr. Cole said:

"Our coal resources are among the greatest in the world.

"Our asbestos deposits in the Eastern townships of the Province of Quebec supply most of the asbestos of commerce.

"The greatest nickel deposits in the world are located at Sudbury.

"Ontario has the largest body of high grade tale on the continent at Madoc; the largest body of high-grade feldspar on the continent in the Richardson mine near Verona; the greatest mica mine on the continent at Sydenham and the greatest graphite mine at Calabogie.

"During 1916 also a molybdenite property was discovered within 25 miles of Ottawa that bids fair to outstrip all rivals.

"The tar sand deposits of Northern Alberta are the most extensive in the world.

"We also have one of the richest silver camps in the world at Cobalt, and the most promising of the younger gold camps on the continent at Porcupine.

"Our smelters at Deloro and Thorold also produce more refined cobalt than all the other refineries in the world put together.

"These are just a few of the lines on which we lead, but the remainder of our production is by no means insignificant."

The British Columbia correspondent of The Journal writes: "Recently there was published in Provincial newspapers a press despatch from Ottawa stating that 'the collieries in the Crow's Nest Pass district of British Columbia, which are being operated under Government control, are producing 23,000 tons of coal a day, the greatest output in the history of the Province.'" This, the correspondent points out, is a gross misstatement, for the total output of all the coal mines operating in that district for October was only 68,044 tons, and of those of the whole of the Province 230,996 tons. He adds: "Allowing for twenty-six working days, which, however, is probably more than any of the mines worked, the production of all the mines in the Province would have been less than 9,000 tons a day; if they worked an average of twenty days, a total of about 231,000 tons would mean an average of only 11,550 tons a day for the whole of British Columbia, so that it is quite evident the Ottawa correspondent was very far astray."

Northwest Mining Truth, published in Spokane, states that it "understands upon unofficial, though highly credible authority, that examination of the books of the Lucky Jim Zinc Mines, Ltd., has disclosed an alarming over-issue of stock. Just what figure it will reach is not yet known, but there are rumors that it will go as high as 2,000,000 shares. If this should prove true, the very serious position of all stockholders can easily be understood. The authorized capital is \$2,500,000 in \$1 shares, so that a total of 4,500,000 may be in existence at the present time. The question of criminal liability as well as the position of holders of over-issue are matters now giving much concern to

Coal Trade of Nova Scotia During 1917

By F. W. Gray.

In last year's review of the Coal Trade of Nova Scotia the writer stated:

"In a period when the necessity for increased production of raw materials is being preached by the responsible statesmen of every belligerent nation the very considerable diminution in the production of our most important raw material is sufficiently serious, particularly so when the low figures of 1916 follow large recessions in output during the preceding years of 1914 and 1915, but a still more serious aspect is the probability that the tonnages of 1917 will show a further decline, probably to between 5½ and 5¾ million tons, or say, two million tons below the maximum possibility."

This forecast has in the actual event proved only too accurate. The production of coal in Nova Scotia during 1917 has been about 5,735,000 tons, comparing with 6,174,424 in 1916, or has declined a further 440,000 tons below the reduced figures of 1916.

Most unfortunately it is probable that the production of 1918 will decline to a still lower level, say to between 5¼ and 5½ million tons. From present indications it may be expected that 1918 tonnages will show a decline from 1917 figures of possibly 350,000 tons.

An indication of the disappointing trend of production may be obtained from the following table of annual outputs:

Annual Coal Production. of Nova Scotia. (Long Tons)	
1913	7,263,485
1914	6,650,038
1915	6,708,695
1916	6,174,424
1917	5,735,000 (about)
1918	5,400,000 (estimated)

The salient features of the year are those of last year, namely, the large decreases in the production of the larger coal operators, and the number of small operators. At least eight new coal companies have joined the producing ranks in Nova Scotia this year. These operations are small, but in the aggregate they account for 100,000 tons of coal output in 1917.

The activity of the smaller operators is of course a reflex on the high selling price of coal, and is one of the features of an abnormal situation which favors the commencement of new enterprises, as a rule requiring little capital expenditure, but on the other hand presents most serious difficulties to the larger companies, which in many cases have a lean past and an uncertain future outlook.

The enterprise of the smaller operators has aided in the supplying of local needs, and has to that extent relieved the general coal shortage, but the contribution of the smaller companies does not, and cannot to any appreciable degree offset the tremendous decline in the production of the larger operators.

The smaller operators are working on areas that have either been abandoned in times of depression, or even in what we call normal times in Nova Scotia, or areas situated on the outcrops of the main coalfields.

When it is considered—as was stated last year—that taking into account the selling price of coal, the cost of labor and materials, and the margin of profit left to the coal operator, the price of coal in Nova Scotia has never within the past 25 years (up to 1916) been sufficiently high to make coal-mining a reasonably paying investment or to secure the stability of the companies engaged in the mining of coal in this Province, the disappearance of many of the smaller operators from the producing lists may be expected so soon as the present unusual conditions pass away. But the larger companies cannot cease operations at will. They must take the good with the bad, and it is with much anxiety that the larger companies now view the future, and not without reason, as the following summary will show.

By a shortage of labor, the production of coal has been reduced by from 25 to 40 per cent. but no corresponding reduction has been possible in the overhead expenses of transportation, staff, financial burdens, such as interest on bonds and other loans, or in the fixed costs of mining, as pumping, ventilation and general maintenance. The amount of coal available for sale at current favorable prices is reduced by the drop in production, and by the operation of long-term contracts at lower prices than those now prevailing. Increases in wages have been granted more quickly and of greater extent than ever before, and further increases of a most drastic nature are demanded. Costs of all mine materials have increased. The practical cessation of capital expenditure since 1913 is now having its effect on the costs of mining, and the longer these capital expenditures are delayed by lack of labor and difficulty of obtaining materials the more costly will mining operations become. Neither men or materials are at all likely to become plentiful while the war lasts, and for many years after peace is declared the coal production of Nova Scotia will show the result of the period of arrested development through which it is now passing.

Accompanying this combination of adverse factors is the temporary loss of the Montreal market, because in 1917 the shipments to the St. Lawrence did not exceed 50,000 tons. Whether and when this market can be regained is a matter on which predictions cannot be hazarded.

The percentage of coal consumed in the manufacture of iron and steel is again very noticeable. The percentage is increased not only by the large amount of coal used at the steel works, but by the reduction in the total coal production. It would not be a surprising development of present onerous conditions to see some at least of the coal operators of the Province retire entirely from mining coal for general sale, and confine their energies to securing coal for use in metallurgical processes.

It may even be that a logical outcome of the rising costs of coal mining, and the difficulties which will attend the recovery of the lost markets will be a tendency to export manufactured articles from Nova Scotia coalfields in preference to exporting the coal to distant manufacturing centres. It has only been the low costs of freighting in previous years that enabled

Lawrence markets, but the permanently increased costs of extraction and the improbability that freight rates will return to normal as rapidly as they increased to present figures, are factors which will seriously militate against quick recovery of the lost markets.

Cape Breton Island produced 77 per cent. of the provincial total output, which is a falling off from the record of the past six years, during which period Cape Breton maintained a steady proportion of approximately 81 per cent. of the total production. This temporary recession of Cape Breton Island is interesting as a reflex of the large enlistments from the Island, but when industry resumes its normal progress it is quite certain that a steadily increasing percentage of the Nova Scotia coal output will come from Cape Breton Island.

The year has seen an unusual number of political and legislative changes. At the beginning of the year a new Workmen's Compensation Act came into operation, by which administration by a Provincial Board and compensation payments out of a Provincial Fund were substituted for direct payments of compensation from the employer to the injured workman. A schedule of pensions was also substituted for lump sum payments at death. The cost of the assessments made by the Board will amount to probably ten cents per ton on the cost of coal. The legislation has had a disastrous effect on the colliery relief societies. The Nova Scotia Workmen's Compensation Act will in the long run probably prove a beneficial piece of legislation, but unfortunately sufficient attention was not paid by the Legislature to the probable effect upon the relief societies, although the matter was carefully brought to the notice of the Legislature by the representatives of the relief societies.

The enactment of weekly pays became operative in May. This innovation has certainly not increased the production of coal, but it has definitely increased the cost of coal. The effect on one coal company has been an addition of \$20,000 to the annual expenditure for clerical help and stationery, and the employment of 25 additional clerks. The legislation may be considered in line with modern ideas, but some consideration might have been given to the fact that the country is at war, and that the net result of weekly pays has been to reduce the production of coal, to increase its cost, and to increase the number of clerical employees, at a time when coal is scarce and dear, and men are needed for fighting and for actual production of materials.

The year was unfortunately marked by a mine explosion at New Waterford by which 65 men lost their lives. This incident has already been fully described in previous issues of the Journal, and need not be here dealt with in detail. As an outcome, however, of the verdict of the Coroner's Jury, indictments were brought in by a Grand Jury charging manslaughter against the Superintendent and Manager of Dominion No. 12 Colliery, and against the Deputy Inspector of Mines for the Waterford District. So far as is known there is no precedent for this sequence of events, and the position of the Deputy Inspector of Mines is particularly significant, as it has hitherto been assumed that this official was a representative of the Provincial Department of Mines, reporting to the Inspector of Mines. Mine managers and colliery officials, holding certificates of competency from the Department of Mines, have hitherto regarded themselves as responsible for the

Inspector of Mines and his Deputy Inspectors, and have not considered these officials as jointly responsible for the conduct of mining operations with the colliery officials.

It has not been usual for criminal proceedings to be instituted in connection with the responsibility for mining accidents without the intervention of the department of the Government charged with the oversight of the mining laws, or without some specific breach of the Coal Mines Regulation Act had taken place. The disturbing feature in the present incident is that criminal proceedings were instituted after a Commission of Enquiry under the chairmanship of the Inspector of Mines had found itself unable to assign blame, and so far no specific breach of any section of the Coal Mines Regulation Act had been charged.

One curious fact may be noted. The genesis of the explosion was a shot fired under conditions that caused the disaster. That much may be admitted without the necessity to particularize further. There is no regulation in the Nova Scotia C. M. R. A. governing the use of explosives in coal mines, except a series of regulations contained in the "Special Rules" of the Dominion Coal Company, which by compliance with certain rules as to posting and approval by the Inspector of Mines, have the force of the Act so far as the workmen of the Dominion Coal Company are concerned. It can scarcely be maintained under these circumstances that the operators of the Province have been lacking in a desire to improve the mining practice, when as a matter of fact the C. M. R. A. has been supplemented and improved by the careful formulation of rules that are the result of much thought, and incidentally of large expenditures.

The trial of the colliery officials who have been indicted will attract a great deal of attention in Nova Scotia, and the matter is one which should be followed by all mining officials in Canada as it has a most important bearing on the status of the profession. It has also a grave bearing on the technical progress of mining, as if the procedure which has been followed in Cape Breton becomes a precedent, and criminal proceedings commence to follow upon mining accidents without the intervention of the Departments of Mines, or those authorities charged with the regulation of mines, it will kill all individual responsibility and initiative among mining officials, who will either prefer to take no chances of any kind, or will seek professions which offer equal or greater remuneration with less onerous risks.

MINING CORPORATION PAYS \$1,556,296.

By an unfortunate typographical error the Mining Corporation of Canada was credited, in an item published in our last number, with paying dividends amounting to \$1,556 in 1917. The company distributed in dividends during 1917 \$1,556,296.

Two or three new coal mines have been opened recently on Vancouver Island, B. C. One of them is situated at Nenoose, a few miles north of Nanaimo. Its output of coal in November was 4,303 tons, bringing its total up to 22,872 long tons. While this is but small in comparison with the production of the large mines on the Island, it is an encouraging beginning.

FLOTATION-PATENT LITIGATION

An interesting article by R. C. Canby, on the Status of Flotation-Patent Litigation in the United States, appeared in the Dec. 1 number of "The Engineering and Mining Journal." Mr. Canby said in part:

It is unfortunate for the clearness of the situation that the majority opinion of the United States Circuit Court of Appeals, in Philadelphia, in the case of Minerals Separation vs. Miami Copper Co., was technically for the plaintiff, whereas, in actual point of fact, it was in favor of the Miami Company, in that it indicates that its present milling operations are not infringing the flotation patents of Minerals Separation. The opinion referred to was based upon a review of the record in the hearing before Judge Bradford in the United States District Court in Wilmington, Delaware.

The alleged infringing acts complained of by Minerals Separation, in its bill of complaint, occurred in experimental flotation tests carried on before the time that the Miami Company had introduced flotation into its actual commercial operation.

An important difference between the Hyde case and the Miami case should be particularly noted. In the Hyde case the flotation operations under consideration had been carried on in a machine having mechanical agitators or beaters, whereas in the Miami case the concentrating operations were performed in the Callow cell, an apparatus in which the necessary aeration is obtained absolutely independent of any agitation.

It was of the greatest help to the Court of Appeals in Philadelphia to have before it the Supreme Court decision in its consideration of the Miami case. This Supreme Court decision had been considered by Minerals Separation as a tremendous victory. But when applied to the bubble-column mode of flotation, such as takes place in the Callow porous-bottom cell, the decision is most embarrassing to the contention which Minerals Separation tried, unsuccessfully, to sustain.

The opinion of the United States Court of Appeals in the majority opinion of Judge Woolley, and particularly in its minority opinion, by Judge Buffington, is really in favor of the Miami, since the infringing features specified in Judge Woolley's opinion, although having been in the experimental plant, do not constitute a part of the operating plant of the Miami Company, except as stated. When the Court of Appeals opinion is applied to the actual concentrating plant of the Miami Company, none of the infringing features is found.

This article ought to make it clear that the broad claims that Minerals Separation is making to practically the whole flotation field have not yet been sustained by the courts.

In the presentation of its case, in the Miami trial, Minerals Separation laid no little stress upon the "acquiescence" indicated by the fact that the Inspiration, at first under its original contract, and subsequently under the Anaconda contract and supplemental agreement, pays royalty on the tonnage of all of the mill units, regardless of the type of machine.

It might appear, if one went into it, that there was "good business" in this Anaconda contract. One of the Anaconda subsidiaries, the Inspiration, was already under an irrevocable contract to pay the regular Minerals Separation royalty, so, as was brought out in the cross-examination in the Miami suit, it was not only partially a form of insurance, but may well have been

worth \$300,000 to release this subsidiary company from its existing Minerals Separation contract, for the benefit of the lower royalty of the sliding scale of the Anaconda "supplementary agreement."

The Anaconda contract and supplementary agreement may be criticized from many angles, but one cannot but notice that its "acquiescence" is dependent solely upon the Supreme Court's "final decision" in the Hyde case, rather than upon any subsequent decision of the Supreme Court affecting the patents at issue. But, if one considers all of the conditions involved, it certainly lessens materially the force of the Anaconda contract as an instance of "acquiescence."

I mention this matter of acquiescence somewhat at length, because such acquiescence has considerable weight, not only with the court to whom it is addressed, but more especially with the mining public as a whole. The mining public should pause and find just where it stands. It should consider what danger there is of doing an injustice, on the one hand, or of too readily acquiescing in an injustice to itself, on the other hand.

The Supreme Court of the United States had found a novel degree of agitation, greater than theretofore known, which produced a permanence of froth, of a character not theretofore known, and the use of a critical amount of oil. There was no testimony in the Hyde record to show that greater quantities of oil than the "critical" amount could be used successfully in the actual mill. It would now appear that the Supreme Court was misled by this record, since numerous plants are successfully using oil far in excess of the minute quantity characteristic of the claimed process, and slightly in excess of the limit named by the patent, one per cent.

In the most recent litigation, the Butte & Superior case, argued before the United States district court at Butte, Mont., one finds Minerals Separation taking again an entirely new and different attitude. Confronted as it now is by so many actual metallurgical operations in which oil in excess of 1% was being successfully used, it took precisely the position which its opponents had always argued in every prior case, and which Minerals Separation has denied in every prior case; namely, that "oil" used in any excess over that "which is attached to the metalliferous content of the concentrates" is "wasted," "unutilized," "and might just as well flow down the outside of the machine." This is the exact opposite to what Minerals Separation attorneys argued before the Supreme Court, in the Hyde case, and absolutely contrary to the contention upon which the Supreme Court sustained the patent and found the efficacy of the "critical quantity" of oil.

Flotation Takes Place in Modified Water.

In litigation certain assumptions of theories as to the underlying causes of flotation have been advanced by one side or the other, as, for example, in the Miami case, the moving-picture film of bubble-holder experiments in the Wilmington court, by the plaintiff, with the object of showing a different degree of attachment of air bubbles for sulphide with large amounts and minimum amounts of oil. The Miami company contended that flotation takes place in "modified water;" that is, water having a contaminant which reduces its surface tension, with the idea of illustrating that all of the various prior-art processes, as well as that of the patent in suit, No. 835,120, were fundamentally identical, all being dependent upon the same underlying principle; that it is the modifying of the

surface tension that is necessary, and that, having added sufficient contaminant to modify the surface tension, any excess, more or less, of the contaminant or modifying agent, is immaterial, apart from the question of economy.

I have been greatly impressed by the fact that since the Miami case was argued in Wilmington a number of papers have been written by professors and instructors in our technical schools discussing the underlying principles of flotation. These papers were prepared in the laboratories of the technical schools, the authors being unbiased by any particular interest and untrammelled by the necessity of sustaining a particular theory, and yet none of these writers has found the "critical quantity" of oil. At the hearing of the Butte & Superior case before the district court in Butte, several testified as to their methods of investigation, and reproduced their demonstrations before the court.

The quotations from the testimony of experts or the arguments of counsel, while enlightening, are not so important, now that we have the opinions of the United States Supreme Court and the United States circuit court of appeals as a guide. The decision of the Supreme Court, which is based upon the record in the Hyde case, absolutely limits the Minerals Separation flotation process to what is generally known as the agitation froth process, having "an agitation greater than and different from that which had been resorted to before," and a "resulting froth concentrate so different from the product of other processes." The decisions of the United States circuit court of appeals in Philadelphia, both majority and minority opinions, would unquestionably place any partly mechanical violent-agitation froth process, with less than 1 % of oil, within the scope of the patents.

When, however, one comes to the bubble-column form of flotation apparatus, with which 17 out of 18 units of the Inspiration mill, as well as a large number of other American flotation plants, are operated, a different proposition is presented.

Bubble-Column Machines Are Claimed to Be Without the Scope of the M. S. Patents.

These bubble-column machines, the Callow-type machine, the Inspiration-type machine, etc., are not agitation froth machines, and therefore do not come within the scope of any of the patents, Nos. 835,120, 962,678 and 1,099,699, as these patents were defined by the United States circuit court of appeals in Philadelphia in the Miami decision or as No. 835,120 was defined by the United States Supreme Court in the Hyde case. When these decisions in their relation to the bubble-column operations, such as the Callow cell, for example, are considered, the question becomes solely whether the result produced in the porous-bottom cell is the effect of agitation. I consider that it has been established that this is not the case, and that such a porous-bottom, bubble-column cell itself, therefore, operates entirely outside of the scope of these patents.

No sentences could be more clearly worded to state emphatically that the operation of the Callow cell is not the agitation of the patents in suit than those in the majority opinion of the court, as written by Judge Woolley and already quoted. In writing the minority opinion of the court, Judge Buffington says, in conclusion:

"I would hold that the step of the process 'agitating the mixture until the oil-coated mineral matter forms into a froth,' meant the novel air-entraining

agitation which the patentees disclose, and did not cover the novel air-releasing agitation which the defendants disclose."

Moreover, Judge Woolley says, in the majority opinion of the court:

"But in the process we are considering, and upon which the decree we are reviewing was based, the Callow cells were not the whole process, but were merely the last of four distinct parts of the process, the other three being the process of the patent or its fair equivalent."

This is an absolutely clear statement that it was "the other three" parts of the process, the centrifugal pump, the "break in the circuit" and the Pachuea tank, and not the Callow cells, the fourth step, which were "the process of the patent or its fair equivalent."

Looking back to the time of the supposed "discovery" of the process set forth in patent No. 835,120, it will be noted that the disclosures in the flotation art were already too numerous to admit of anything really basic being claimed.

I feel that the legal situation also has been cleared by the decisions of the United States Supreme Court and the United States court of appeals in Philadelphia, so that there should now be nothing to retard further the development of flotation along the lines so successfully pursued by our American engineers in bubble-column flotation.

The Butte and Superior Decision.

Since writing the foregoing, Judge Bourquin has handed down (Aug. 25, 1917) the opinion of the United States district court at Butte, Mont., in the Butte & Superior case. Because of the fact that the method of operating, which has been considered by Judge Bourquin and upon which his decision is based, is so entirely different from the method of porous-bottom cell, Judge Bourquin's decision has absolutely no bearing whatever upon the porous-bottom cell method of operation.

Judge Bourquin may have been completely confused by the plaintiff's new line of argument. What he says as to "self-agitation," agitation by the air particles "in merely rising through the mass," is in absolute conflict with the distinction made by the court of appeals in Philadelphia, and is actually nothing less than the reinstatement of the original claim 12, which was properly denied patentability by the United States Patent Office, and subsequently abandoned by the patentees themselves. The porous-bottom cell method of operation was not before Judge Bourquin, so he may not, therefore, have so fully realized the distinction between the two methods of aeration as would otherwise have been the case. He certainly could not have been conscious of how much the specious arguments of the plaintiff's counsel induced him actually to read into the patent, nor to what extent he was thereby placing his opinion in absolute conflict with the court of appeals in the Miami case.

There are unfortunately also many among the mining public who do not fully understand the legal distinction which exists between the violent-agitation froth method and the porous-bottom cell method of flotation, and who may not realize that Judge Bourquin's decision has no reference whatever to the latter, and thereby may be led to further misunderstanding of the real situation through the unwarrantedly wide scope claimed for Judge Bourquin's opinion by certain correspondents in financial and other journals.

CANADIAN IRON ORE MINES

By A. H. A. Robinson.

Discovery of iron ore in Canada is recorded as early as 1667; and in 1733 there was already one forge in operation. This earliest plant was succeeded in 1737 by a group of forges at Three Rivers, Quebec, which remained in active operation almost continuously until 1882, being at that time the oldest active iron producers in America. A number of other small plants were erected at various points in Canada during the latter part of the eighteenth and the earlier part of the nineteenth centuries; but the iron industry did not assume any large proportions, or commence to take on its modern form until 1896. Since then its growth has been rapid.

In the earlier days, when the iron industry was small, sufficient ore was available locally to meet all the demands of the furnaces. Since 1896, however, this condition of affairs has changed; both the production of iron ore and its consumption in blast furnaces have increased; but the latter so much more rapidly than the former that in 1916 the total production of iron ore in Canada was only equal to 15.5 per cent. of the total ore smelted in Canadian blast furnaces.

Practically all the imported ore comes either from Wabana, Newfoundland, or from the Lake Superior iron ranges in the United States. It might be noted in passing, however, that the word "imported" has not the same significance as applied in the two cases. The Wabana ore, on which the Nova Scotian iron and steel industry is based, comes from a sister British colony, and is owned and mined by Canadian companies for use in their own furnaces; on the other hand, the Lake Superior ores are owned and mined by United States interests, and are bought on the open market by the Ontario smelters.

At present almost all the Canadian ore produced is the output of two mines, the Magpie and the Helen. Both are situated in the Michipicoten district, in Ontario, and both are owned and operated by the Algoma Steel Corporation of Sault Ste. Marie, Ontario.

In any consideration of Canada's iron ore resources, a point that should not be lost sight of, is that the total area comprised in the Dominion is very large, and that much of it is practically unexplored so far as its iron ore possibilities are concerned. With very few exceptions, all the known occurrences are situated in the older and more or less settled and known districts. In the comparatively unexplored regions of the north, large areas of iron bearing rocks occur at a number of points, but, on account of their inaccessible location there is, at the present time, little to induce a thorough exploration of them in a search for ore bodies.

A summary review of the iron ore situation in the different provinces follows:

British Columbia.

Up to the present the production of iron ore in British Columbia has been an almost negligible quantity. The total recorded from 1886 to 1903, both years inclusive, was only 62,578 tons; since 1903 the only production recorded was in 1907, when 2,500 tons were shipped.

Most of the ore—practically all magnetite—was sent to Irondale, Washington, U.S.A., where it was used in the production of pig-iron in a small charcoal blast furnace. The balance went to lead smelters to be used as flux.

The small production of British Columbia has been due, not so much to the lack of iron ore deposits, as to the lack of a market for the ore. In the absence of a local iron smelting industry, there has been no particular incentive either to develop the known ore-bodies, or to search for new ones.

The different varieties of iron ore found in British Columbia include magnetites, hematites, limonite or bog ores, and clay ironstones. The most important of the known ore bodies are a series of magnetite deposits which occur on the islands along the coast in the western part of the province.

Alberta, Saskatchewan and Manitoba.

Up to the present time, no iron ore deposits of such size and quality as to make them of commercial value have been found in the Middle West provinces. There are, however, very large areas unprospected in all three, in which iron ores may be discovered in the future.

Several writers have drawn attention to the fact, that a steel plant located in western Alberta would have essentially the same location with reference to coal-fields and transportation routes as the Colorado Fuel and Iron Company's plant at Pueblo, Colorado. The favorable situation with respect to the coal-fields and the growing industrial market of the prairie provinces should, therefore, make the discovery of even a moderately good iron ore deposit in this district, or in the adjoining portions of eastern British Columbia, a matter of more than ordinary importance.

Ontario.

Previous to 1889, all the ore mined in the province, with the exception of such small quantities as were used in the earlier attempts at iron smelting, was exported to the United States. From 1889 to 1895, both years inclusive, production ceased entirely. About 1896, a system of bounties inaugurated by the Federal and Provincial Governments to encourage the manufacture of iron and steel from native ores, had the desired effect of stimulating the industry, and the following years witnessed the erection of blast furnaces at various points in the province: at Hamilton in 1895; at Deseronto in 1898; at Midland in 1899; at Sault Ste. Marie in 1904; and at Port Arthur in 1907. Strenuous efforts were made to use Ontario ores as far as possible and thus obtain the advantage of the liberal bounties offered; iron mining took on a new lease of life, and prospecting for iron ores became general.

In eastern Ontario old mines were re-opened, and for a time ore was shipped in small quantities. Unfortunately the quality of most of it was poor, and cobbing had to be resorted to, to rid it of sulphur and other deleterious ingredients, and bring it up to merchantable grade. As a result these mines have again, one by one, lapsed into idleness.

In northwestern Ontario, the discovery, in 1899, of the deposit of brown hematite that later developed into the Helen mine, together with the fact that throughout this part of the province there are widespread outcrops of banded jaspers, magnetites, and hematites, of the same geological formations as the Vermilion and Mesabi iron ranges in Minnesota, led to feverish activity in the search for iron ore. Very large sums of money were spent in looking for new deposits and in the exploration of the known ones. The net results of these efforts have been disappointing; we have, it is true, the Josephine mine (still undeveloped); Atikokan, with its high sulphur ores; the Magpie, Helen and other siderite bodies; and a variety of the lower grade, siliceous deposits of banded iron formation. But the only

large body, both high grade and of good quality, yet discovered in Ontario, is that at the Helen mines.

Quebec.

Iron ore was first mined and smelted in the Province of Quebec early in the eighteenth century, and from that time until 1883, the industry was carried on almost continuously at Three Rivers, in the St. Maurice district. Other furnaces using local ore were operated at Radnor Forges and at Drummondville, the last to shut down being the Drummondville furnace in 1911. The ores used were bog ores, with charcoal for fuel. The output of all the furnaces was small, and the industry derived its chief importance from the superior quality of the pig-iron made.

Furnaces have also been built at various times and places in attempts to smelt some of the other classes of ore found in the province, but all were short-lived, and none of them achieved commercial success.

New Brunswick.

New Brunswick, like all the other provinces in Eastern Canada, except Prince Edward Island, had in early days its small local iron industry based on local ores.

Between 1848 and 1884, about 70,000 tons of hematite, obtained from deposits in the neighborhood, were smelted in a small furnace near Woodstock, in Carleton County. The deposits were very shallow and the iron content of the ore low.

Some limonite from small deposits at Manguerville, a few miles southeast of Fredericton, was also smelted in the same furnace.

As a producer of iron ores, however, the province has never been prolific. From 1889 to 1909 no output is recorded; from 1910 to 1916, shipments to the extent of 202,850 tons were made, all from one mine.

The only known deposits that have any economic interest are those found near Austin Brook, in Gloucester County, about 23 miles southwest of the Town of Bathurst, and known as the Bathurst mines. They consist of fine-grained, siliceous magnetite, with which is intermixed some hematite.

Nova Scotia.

While next to Ontario, Nova Scotia has to its credit the largest aggregate output of iron ore of any province of the Dominion, the total tonnage from the earliest days to the present would not last a large modern plant very many years (in 1915, 840,394 tons of Newfoundland ore was used in Nova Scotia blast furnaces). Latterly, with the exhaustion of the workable deposits of better-grade ore, production has declined until now it has reached the vanishing point. The extensive development of the Wabana iron ore field in Newfoundland, and the ease and cheapness with which Nova Scotian furnaces can secure a supply of suitable ore from that source, have also operated to decrease interest in the development of local supplies.

A BARITE MILL AT PREMIER-LANGMUIR MINE.

At the Premier-Langmuir barite mine in the township of Langmuir, east of Porcupine, a 30-ton mill for the treatment of the barite is nearing completion. We may look for a production from this deposit in the near future. Considerable work has been done on the vein which is 4 ft. to 6 ft. in width and along one wall is argentiferous. Lack of a method of recovering the silver explains why this property was not on a producing basis 4 or 5 years ago.

HOW MINING BENEFITS THE COUNTRY.

Mining is one of our basic industries and it enters more or less into the lives of every one of us. You do not need to be a stockholder in a mine to be financially interested in its development. Take, for instance, the little camp of Cobalt. Of course, a camp to be successful must make profits. Cobalt does that, and the result is the dividends that are paid. If you are a shareholder, that is what you are most interested in. But let us look at Cobalt from another angle, that of a non-shareholder. It costs seven million dollars annually to run the Cobalt mines. After careful enquiry I am convinced that most of the seven million dollars eventually finds its way down to Toronto and Montreal. If you are a merchant or a manufacturer, does not a matter of an extra few millions annually coming into the city interest you? Remember that Cobalt is only one of a number of flourishing mining camps up North. —A. A. COLE.

DEEP EXPLORATION FOR NICKEL ORE.

A most interesting piece of exploratory work is in progress in the Sudbury nickel region, where diamond drilling prospecting is being carried on by the Mond Nickel Co. lot 2, concession I, township of Creighton. The Creighton mine, operated by the Canadian Copper Co., is situated on lot 10, concession I, Snider. The ore body dips northwesterly at an angle of about 45 degrees and it is hoped the drills will encounter ore at a depth of about 3,800 feet. Three holes are being put down on the north part of lot 2, near the boundary line between lots 1 and 2. Reference to the Creighton mine geological map which accompanied the report of the Royal Ontario Nickel Commission will make the situation clear. If this daring and expensive piece of prospecting is crowned with success development of the ore body will involve sinking a very deep shaft, comparable to those of the Rand or Keweenaw Point.

Mr. James Gray, at present manager for a coal mining company operating in Tasmania, expects to return to British Columbia next March. Several years ago he was manager of the Nicola Valley Coal and Coke Co.'s Middlesboro colliery, near Merritt, Nicola Valley, and afterwards for two years, of the No. 7 mine of the Comox colliery, Vancouver Island, owned and operated by the Canadian Collieries (Dunsmuir) Limited.

Mr. K. C. Laylander, of Hydraulic, Quesnel river, Cariboo district of British Columbia, expects to shortly leave for the Eastern States to meet the directors of the Quesnelle Hydraulic Gold Mining Company, with a view to expansion of the company's work in the Quesnel mining division, of which he is in charge. He states that he lately uncovered an immense deposit of black sand, running high in value, and it is with the object of making arrangements for the development of that deposit that he is arranging to go East. The leading men in the Quesnelle Hydraulic Gold Mining Co. are resident in either Pittsburg, or Philadelphia, Pennsylvania.

Many friends in Canada of Mr. A. B. W. Hodges, of Los Angeles, California, formerly for some years in local charge of the Granby Consolidated Company's mining and smelting enterprises in the Boundary district of British Columbia, will be interested to know that he is a member of the Sulphur Committee of the War Industries Board of the United States, which was pursuing its duties in Texas early last month.

FLOTATION AT COBALT, ONT.

Mr. W. E. Simpson, of Cobalt, has an interesting article in the Dec. 3 number of "Mining and Scientific Press" on flotation of Cobalt silver ore. He says in part:

Flotation has proved a useful auxiliary in the treatment of silver ores, and is now in operation at practically every producing mine in the Cobalt district. Mines originally equipped with plants for gravity concentration have bettered their recovery as much as 5 to 15 per cent. through the addition of flotation units, while the added cost is from 5 to 15 cents per ton. With the all-sliming process (grinding in cyanide solution), extensive experiments indicate that when recovering the refractory minerals by flotation, the usual revenue is maintained or improved, and that the consumption of cyanide is reduced one-third. The chief difficulty with flotation lies in the disposal of the concentrate, marketing to distant smelters being expensive and local treatment not yet having proved satisfactory. Threatened litigation by Minerals Separation, Ltd., is also seriously embarrassing metallurgical progress in the Cobalt district.

The earliest application of the flotation process to the treatment of silver ores at Cobalt dates from 1910, when some small-scale tests were made in the laboratory at the Coniagas mine, to note the effect, if any, of violently shaking representative samples of mill-pulp to which had been added a few drops of oil. No commercial importance was attached to the results obtained in these simple experiments and the matter remained in abeyance so far as that mine was concerned until quite recently.

The next attempt was made in 1914, when a former employee of the Minerals Separation Company constructed an experimental unit at the Temiskaming mine and demonstrated the feasibility of profitably treating the fine tailing, then being run from the concentrating mill to the waste-pile. The litigation ensuing over the use of flotation acted as a deterrent to the continuance of experiments.

While these tests were being conducted, a sample of slime, representative of what may be now called flotation-feed, was sent by the Cobalt Reduction Company to its consulting engineer in London to determine whether the flotation process could be introduced successfully in the Cobalt district. The tests were made in the laboratory of Sulman & Picard, metallurgists for Mineral Separation, Ltd., and the results were as follows: The sample assayed 5.5 oz. silver per ton, and the products obtained were a concentrate assaying 43.5 oz. containing 57.11 per cent. of the silver in 7.3 per cent. of the weight of the original slime, a final tailing assaying 1.99 oz per ton with 24.88 per cent. of the gross content left in 69.15 per cent. by weight of the slime, and a middling containing the rest. Alf. Tellman, who signed the report, concluded by saying: "I believe that if the slime can be successfully treated by cyanide, you will be able to make more profits than with flotation."

The serious adaptation of the flotation process to the Cobalt ores really started when T. R. Jones, manager of the Buffalo Mines, after conducting an extensive experimental campaign, installed the first treatment plant to operate on a commercial scale in October, 1915. This unit employed the Callow type of machine and had a capacity of from 50 to 75 tons per day. So satisfactory were the results that

additional plant was immediately erected, bringing the total capacity to 600 tons per day in September, 1916.

The first flush of success led to the statement by enthusiastic operators that flotation would entirely replace the gravity method of concentration, completely displace the cyanidation of Cobalt ores, and revolutionize the established practice of metallurgy. Further experience, however, has called for a modification of these views. A satisfactory recovery of the silver-bearing minerals by flotation is only obtainable from material in a fine state of subdivision, and the tendency now is to apply the process to the treatment of slime and to such portions of tailing as may be sufficiently rich to warrant the additional expense of fine grinding.

Applicability of Flotation—In reaching a decision regarding the adoption of a process and the installation of a plant, two factors exert an influence in favor of flotation at Cobalt more than in mining districts generally; these are (1) the winter is long and heating is costly, and (2) many of the mines appear to have already passed the zenith of their prosperity, their ore-reserves being now narrowly limited in extent. The most desirable process for the Cobalt mines therefore is one that can be housed in the smallest building and installed with the lowest capital outlay. Experience has proved that a flotation plant can be erected in a space less than one-fourth that required for either a group of gravity-tables or a cyanide-plant of equal capacity. In a modern mill for treating 100 tons per day it is estimated that a saving in capital expenditure of about \$20,000 can be effected by the substitution of the new for either of the older methods. The working profit also favors the newer method. The chief handicap to flotation is its inability to produce a finished article, that is, one easily marketable, such as high-grade bullion. Flotation in reality is a method for concentrating valuable mineral into small bulk, the ratio of the weight of material treated to that of the product being, in the Cobalt district, approximately between 50 and 100 to 1. This concentrate either must be treated locally or sold to distant smelters, whereas if cyanide bullion is produced no further treatment is necessary.

The litigation, with which the Cobalt district is being threatened, prohibits the publication of authoritative details for fear that they may be used subsequently in law-court proceedings. It may be stated, however, that, as a general rule, the recovery varies from 75 to 90% of the silver in the material treated by flotation and the cost of the actual operations from the time of receiving the slimed feed to that of discharging the finished concentrate is roughly 20c. per ton.

Minerals Separation.—In harmony with its attitude elsewhere, the Minerals Separation Company, through its subsidiary organization, the North American Corporation, has threatened proceedings against all users of flotation in the Cobalt district, so as to collect, if possible, the royalty of 2 1-2 per cent. of the gross value of the whole concentrate recovered, according to the usual demands of this patent-exploiting company. The success of flotation at Cobalt is due entirely to local enterprise, therefore this demand is resented bitterly. The indications are that a legal fight is to follow, and a campaign has been started to enlist Government action "with a view to having the patents annulled." Amid the legal turmoil, metallurgical progress is being seriously handicapped, the

free exchange of ideas has been completely stopped, and an embargo is being placed on valuable information. It is sincerely hoped that an equitable settlement may be obtained at the earliest possible moment.

Flotation is undoubtedly destined to play a part in all milling operations in the Cobalt district, although its scope will not be as extensive as was at first anticipated. As a competitor to the sand-table it has not met with the success gained in other localities for the reason that the valuable minerals are difficult to float and are easily recoverable by gravity-methods. For successful flotation, the arsenic, nickel, and cobalt minerals, with which much of the silver is associated, must be reduced to a fine state of subdivision in order to conform to some flotation law in which the ratio of surface-area to mass is an important factor. Fine crushing is expensive; consequently the best field for flotation lies in the treatment of primary slime. On this material, it has already completely superseded the slime-table, the additional revenue being greatly in excess of any additional cost incurred. One concentrating plant treating 150 tons of ore per day has been able to add to its recovery from 200 to 300 oz. of silver in concentrate daily, the additional revenue being directly attributable to the introduction of flotation for the treatment of slime. The approved type of gravity mill for Cobalt, therefore, should contain jigs for the extraction of the coarse metallic silver, gravity tables for the treatment of sand, and flotation for the slime.

MAGNESITE FOR FURNACE LINING.

Lately the Quebec magnesite industry has taken an important step forward. The two principal operators, the North American Magnesite Company, and the Scottish Canadian Magnesite Company, are now making dead-burned magnesite, containing a suitable percentage of iron, for furnace lining. The magnesite is being burned in the cement kilns of the Canada Cement Company, at Longue Point, near Montreal, and at Hull, near Ottawa. The product is very satisfactory and widely used. The North American Magnesite Company has obtained a lease on a promising property in Harrington township, and a gang of men is at work mining magnesite and storing it, awaiting winter roads to haul it to the railway.

Recently there was published in The Daily Colonist, of Victoria, B. C., some information along the lines of editorial comment made in this Journal on December 1 relative to the proposal that printing of the publications of the Canada Department of Mines be stopped. Writing to that newspaper, a resident of Victoria bore testimony to the value of at least one of the Geological Survey reports, information obtained from which, he stated, had led him to prospect in a part of Vancouver Island within forty miles of Victoria, with the result that he discovered copper ore and located mineral claims, the development of which has been undertaken by a prominent mining engineer who is known to be acting for mining men of wide connections and good standing in the United States. He gives his experience as a striking demonstration of the value of at least one of the departmental reports, and adds that "an ounce of fact is worth a ton of theory," especially as there is promise of a productive mine being the eventual outcome of his having read the Geological Survey report to which he referred.

OBITUARY.

On November 9 the news was published at Trail, British Columbia, that Major Kenneth Burpee Carruthers had met his death while serving his country in France. Major Carruthers was for ten years in the employ of the Consolidated Mining and Smelting Company, at its mines at Rossland, at Moyie and Kimberley in East Kootenay, and still later at its Molly Gibson mine in Nelson mining division. He was a graduate of McGill University and of the Royal Military College, Kingston. Shortly after his enlistment for active service he was made a captain of heavy artillery; and was officer commanding the 29th Field Battery, C. E. F. He had served between two and three years in France, in which country a brother was also killed. His age was about 36 years, and his death is widely regretted in the Kootenay districts of British Columbia, in which he had many friends.

Mr. Grant B. Schley, president of the Howe Sound Company, of New York, the holding company of the Britannia Mining and Smelting Company, operating in British Columbia, died at the age of 70 years at his home at Far Hills, New Jersey, on November 22, after a comparatively short illness. The Daily Province, of Vancouver, B.C., states that although his health had not been what might be called robust, it was not expected that his death was so near. Two months ago he had a serious setback, but his recovery was confidently looked for, so that his death was a surprise to many of his friends. It was in 1904 that the late Mr. Schley commenced to take a keen interest in mining in British Columbia, and, after lengthy negotiations, he secured control of what is now the Britannia Mining and Smelting Co., the property of which near Howe Sound, in Vancouver mining division, has since been developed into one of the large copper mines of Canada. The Province states, further, that during the time he has been connected with it, Mr. Schley has invested between \$7,000,000 and \$8,000,000 in the property, and the fact that its mining and concentrating operations are now on such an extensive scale, as compared with those of days gone by, is due in large measure to his foresight and energy.

The death occurred at Nelson, B.C., on November 19, of Professor Arthur Lakes, the well-known geologist and writer, at the age of 75 years. He was born in England, where he received his education. While still a young man he went to the United States, where, says the Nelson Daily News, he finally took up the study of geology and practical mining. Afterward he was a professor of geology in the University of Colorado. He had been, for many years, a frequent contributor to mining journals and other publications. For several years before his death he had resided in Nelson.

COST ACCOUNTING FOR OIL PRODUCERS

The U. S. Bureau of Mines, Department of the Interior, has recently issued Bulletin No. 158, on "Cost Accounting for Oil Producers," by Clarence G. Smith. This is the first treatise of its kind and is a simple explanation of the methods that may be employed in cost accounting for oil producers, who, on account of the peculiar and unusual conditions affecting oil production, require a much different system of cost accounting than any other class of business men.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

As the year nears its close there seems to be good reason to think that there will be a considerable decrease in the value of the mineral production for 1917 as compared with that for 1916. One estimate published placed the probable total at about \$40,000,000, as compared with \$42,290,000 for 1916, but this was stated to be conditional upon an early resumption of operations at the smelting works and refineries at Trail and the production of ore at the mines that ship to Trail, which conditions, however, have not been fulfilled. Under the circumstances, then, it is unlikely the 1917 total value of mineral production will be nearly as large as that of the year immediately preceding. Without having gone into much detail to make a reliable estimate, the opinion may be given in a general way that while there may be an increase in total value of placer gold, and possibly of zinc, the decrease in value of other metals will be much larger than such suggested increase. Further, it is unlikely that the total output of coal has been any larger in 1917 than in 1916; in fact, the figures available at the beginning of December made it appear that there would probably be a small decrease in the year's gross production of coal as compared with 1916.

There had not been a settlement of labor troubles at Trail by the middle of December, so far as had been made known in Provincial newspapers, but Mr. W. H. Armstrong, of Vancouver, B. C., who earlier in the year had been given the duty of getting the coal mines of Alberta and Southeastern British Columbia into operation after a long suspension of work, has been at Trail endeavoring to bring about an agreement between the striking employees and the Consolidated Mining and Smelting Company. Perhaps before these notes shall have been printed he will have succeeded, but at the time of writing neither party to the dispute appears to be showing any sign of yielding. Besides Mr. Armstrong, there are Mr. McNiven, Dominion fair wage officer, and some officials of the International Union of Mine and Smeltermen engaged in negotiations looking to an agreement.

The closing of the Trail smeltery to receipt of ores from Slocan and other mines has necessitated efforts being made to find another market for them. District newspapers have reported that there is a possibility of arrangements being made for shipment of ores to United States smelting works, and in this connection it is stated that arrangements have been entered into between the Canadian Pacific and American railways for a joint freight rate on silver-lead ores from British Columbia mines to smelteries in the United States.

West Kootenay.

Ainsworth.—The Kootenaiian, Kaslo, states that the suspension of operations at the concentrating works at Kaslo has still further increased the number of unemployed men there.

Announcement has been made that the Utica Mining Co. is to acquire the Bell and Sunset mines for a consideration of \$70,000 in cash and \$800,000 in shares in the Utica company. The Utica mine is situated near the head of Twelve-mile creek in the western part of Ainsworth mining division. The Bell is in Jackson basin, about eight miles south of Whitewater, near the boundary line between Ainsworth and Slocan divisions, while the Sunset is on the mountains forming the

divide between those divisions. Both Bell and Sunset mines have been producers in past years, the former largely of zinc ore and the latter of high-grade silver-lead ore. They are neighboring properties at the head of Jackson basin.

Slocan.—While there has been but little ore shipped from Slocan mines since the suspension of work at the Trail smelting works, other than zinc concentrate from the Standard Silver-Lead Mining Co.'s concentrator at Silverton under its contract with a zinc smeltery at Bartlesville, Oklahoma, U. S. A., few mines have yet completely stopped work as a result of the labor difficulties at Trail.

Near Sandon, the Slocan Star is hampered by lack of money to pay for necessary development work, comparatively heavy liabilities having been incurred to provide additional milling facilities, better water supply for the concentrating mill, aerial tramway, etc., without first having developed sufficient ore to keep things going in such a way as to meet payments when due. The shareholders in the company are now asked to pay an assessment on their shares to tide over the present financial difficulty; meanwhile operations have been stopped.

In connection with the Lucky Jim Zinc Mines, Ltd., it is stated that the former manager, Mr. G. Weaver Loper, has surrendered possession of \$150,000 in bonds he held as security for alleged advances to the company, but no definite action, so far as has been made public, has been taken in regard to the stated large over-issue of shares in the company. The closing of district concentrating plants at which Lucky Jim ore was made marketable and of the Trail smeltery to which shipments were being made, have for the time interfered with the progress the receiver was making toward clearing off liabilities to various creditors of the company.

A different condition of affairs is claimed for the Rambler-Cariboo Mines, Ltd., operating on the other side of the mountain from the Lucky Jim mine. A report published in Spokane, where is situated the head office of the company, follows: Promising conditions have been developed on the fifth and ninth levels of the Rambler-Cariboo mine, according to a report received from the mine, in Slocan district of British Columbia. It is believed important ore resources will be developed on those levels. The concentrating mill has been operated, working only one shift a day since the interruption, of ore shipments following the suspension of smelting at Trail. A fairly large quantity of crude and concentrated ore has been accumulated at the Rambler-Cariboo mill. It is probable, though, that it will be found desirable to stop production at the mine for a while. It is estimated that the company's surplus at the end of November was \$32,000.

Other Slocan notes are that work has been stopped at the Ivanhoe, a small property, near Sandon. Development of the Noble Five group is being continued. Mr. Bruce White, manager of the Noonday Mines, Ltd., reports the outlook for the Noonday mine as satisfactory except that shipment of ore is not at present practicable. The Surprise Mining Co., operating successfully the Surprise mine above Cody and the concentrator just below Sandon, has some forty men at work on the old Bosun property, between New Denver and Silverton, Slocan lake, which mine was a comparatively important producer some years ago until much zinc ore was encountered and a market for it could not then be found. The several properties including the Queen

Bess and Van-Roi, that for some months have been operated by Mr. Clarence Cunningham for himself and associates, are in good shape for maintaining production as soon as buyers can be obtained for their silver-lead ores, and the Hewitt group, in Silverton camp, the last property to be taken over by that syndicate, is stated to have much silver ore of a good grade available for extraction whenever conditions shall be favorable for its being shipped profitably. Other mines in the district are also being operated.

Nelson.—There is little mining news of importance from this division at present. The Daily News, Nelson, has of late given scarcely any information relative to mining in the division, so it seems fair to assume that for the time not much is being done. The chief shipper in recent months up to the time of the closing of the smelting works at Trail in the middle of October was the Emerald lead-ore mine, in the neighborhood of Salmo, where the outlook has been increasingly favorable for maintaining a considerable output of ore. It was stated several months ago that shipment of gold-silver ore was to be resumed from the Yankee Girl mine, near Ymir, with a Boundary district smelting works as its destination, but no information in this connection has been made public in quite recent weeks.

Rossland.—Similarly, no news of Rossland mines is being made public. Only four mines were being worked in the camp when the Trail trouble arose, namely, the Centre Star group, Le Roi, and White Bear, by the Consolidated Mining and Smelting Co., and the Josie group, by the Le Roi No. 2 Ltd. A report from Grand Forks is to the effect that there is a possibility of the Le Roi No. 2 company shipping ore from its Josie group to the Granby Consolidated Co.'s smeltery at Grand Forks, but no definite information as to this has yet been made public.

Boundary.

Early in November The Ledge, published at Greenwood, stated that the Canada Copper Corporation had that week shipped three carloads of copper to New Jersey and had two other carloads awaiting shipment; also, that a second blast furnace at the local smeltery was to be blown in and would be run a short time. For some time past the company had been shipping its blister copper to Trail to be refined at the Consolidated Company's electrolytic refinery, but on the closing of the latter company's works other arrangements had to be made for refining it.

Shipment of ore from the Union mine, in Franklin camp, some fifty miles north of Grand Forks, has been stopped for the winter. Ore from this small mine has been sent to the Granby Company's smeltery during the months when hauling could be done from the mine to the rail-head at Lynch creek, but now that snow has fallen the running of motor trucks can not be continued except under difficulty. A short time ago it was stated that the owners of the Union property were endeavoring to arrange to put in concentrating plant so as to be able also to use some of the lower grade ore occurring in their mine.

Similkameen.

News from Camp Hedley is to the effect that recently there was quite an influx of miners and shovellers, so that the Hedley Gold Mining Company now has an adequate supply of labor at its Nickel Plate group of

According to the Similkameen Star, of Princeton, about 150 miners are now employed at the Canada Copper Corporation's mines on Copper Mountain, twelve miles from Princeton. It is stated, further, that the miners there are paid on the bonus system, and that they earn about \$5.20 a day.

From twelve to fifteen men have lately been employed at the coal mine near Coalmont, taking out coal and getting the mine into shape for being operated again. Some coal is being shipped to Vancouver. The property is now controlled by a syndicate of Vancouver men, including Mr. R. S. Lennie, Mr. Blake Wilson, and others.

PERSONAL AND GENERAL

Mr. J. A. Dresser, of Montreal, and Mr. H. E. T. Haultain of Toronto have been nominated as vice-presidents of the Canadian Mining Institute to succeed Mr. Chas. Fergie and Mr. T. W. Gibson.

A meeting of the Toronto Branch of the Canadian Mining Institute was held on Saturday, Dec. 8, at the Engineers Club. The speakers were President A. A. Cole, of Cobalt, Mr. D. B. Dowling of the Geological Survey, Ottawa, and Mr. John Stirling, Inspector of Mines of Alberta.

Mr. W. R. Wilson, of Fernie, B. C., general manager for the Crow's Nest Pass Coal Company, recently paid a business visit to the Coast districts of Washington and British Columbia.

Mr. George L. Fraser, for the last two years in charge of surface operations at the big copper mine of the Granby Consolidated Company at Hidden Creek, near Observatory Inlet, B.C., is now in charge of development work on the coal lands on Vancouver Island the company has acquired. It is stated that Mr. J. W. Powell, who several years ago was mine manager under Mr. Fraser at the International Coal and Coke Company's mines near Coleman, Alberta, has resigned as superintendent for a coal mining company operating in Kentucky, to take a similar position with the Granby Company on Vancouver Island.

The Victoria, B. C., office of the Ladysmith Smelting Corporation, has been closed, and an office opened by that company in Seattle. Mr. W. J. Watson, resident representative of the Tyee Copper Company, is again manager of the smelting works at Ladysmith, and Mr. Geoffrey B. Kitto has resumed his former position of superintendent.

Mr. E. G. Montgomery, of Rossland, B. C., superintendent of the Consolidated Mining and Smelting Company's Centre Star group of mines, has been examining mining property in Camp Hedley, Similkameen district.

Mining and Scientific Press states that Mr. James G. Parmalee, research metallurgist for the Granby Consolidated M. S. and P. Co. at Anyox, B.C., has accepted a fellowship in metallurgy at the University of Idaho, Moscow, Idaho, in connection with the United States Bureau of Mines.

A report from Telkwa, in Omineca mining division, British Columbia, states that men working on the Cassiar Crown Copper Company's property on Grouse Mountain, in that neighborhood, have sent in to Telkwa word that they have run into five feet of clean ore. The company has its headquarters at Spokane, Wash.

MINERALS SEPARATION PATENTS

In the matter of the Minerals Separation controversy which began in Cobalt, Sept. 10, and which has since spread to all parts of the continent, there is at present a lull. The matter is now receiving the attention of the patent office of the Department of Agriculture. The mine operators have submitted evidence which they believe sufficient to convict the M.S.N.A. Corporation of being under German influence, while the M.S.N.A. Corporation officials have furnished the department with evidence which they claim will clear them of the charges made.

In a free country such as Canada, an individual who makes a discovery which is patentable, is entitled to protection. If the idea is of commercial value, the revenue rightly belongs to the inventor. This is what encourages inventive genius. Yet, that is precisely what the M.S.N.A. Corporation is endeavoring to rob the world of. The proof is this: Any one who subscribes to the license of the M.S.N.A. Corporation thereby enters into a binding contract to not only pay the prescribed terms of royalty, but also to hand over to the licensors all improvements, additions and modifications which may be patentable, and such to automatically become the property of the M.S.N.A. Corporation.

The M. S. N. A. Corporation owns certain patents pertaining to the recovery of mineral from ore by use of the flotation process. Other concerns such as Elmore, and Callow own somewhat similar patents. However, the M.S.N.A. Corporation appears to think all others than their own are infringements. Granting, for the moment and only for simplifying discussion, that this last named corporation does own the rights to the process and that all others are infringers, then the Corporation is entitled to royalty from anyone who wishes to use the process. If the terms of royalty are excessive and tend to burden the mining industry it is for the Government to step in and protect the industry. In arriving at this conclusion however, we also arrive at another. The Corporation can license what it controls but cannot by any stretch of imagination lay claim to any discovery, addition, modification, or improvement made by other individuals while using the process. Because Tom invented a pump he cannot accuse Dick and Harry of infringing when they invent a wind-mill.

In support of their scheming paragraph 3, the M.S.N.A. Corporation has drawn up paragraphs 5 and 6 wherein it is pointed out that anyone who once becomes their licensee must not while using the process nor any time after a discontinuance of the contract dispute or even object to the validity of the M.S. patents. It is doubtful if this latter attempt to silence mining men and metallurgists could be legally enforced, but any one who should be compelled to subscribe to the present form of license would feel more or less bound in honor to live up to the conditions outlined.

Thus, it is plainly up to the Government to first investigate the charges of German control; secondly, to find out what would be reasonable terms of royalty;

The writer has been informed by a gentleman who has for several years been in the service of the M.S.N.A. Corporation, that of all the ideas reported to that corporation by their licensees, in no case has the licensee received any material sum for the discovery, or discoveries.

Another matter which stands out as a possible menace to the progress of metallurgy, and which would tend to indicate that possibly an attempt is being made to evade the patent laws of the country in which they operate, is this: By taking out patents for improvements, additions and modifications, a portion or perhaps all of which are the results of the intellect of their (M. S. N. A. Corporation) licensees, that corporation is constantly coming into possession of a veritable sheaf of legal documents which will possibly be held as a weapon, for many years to come, over the science of flotation. Under cover of meaningless, but confusing legal wrangle the patents of 1916 might well be employed as a means of carrying the monopoly on for another dozen years or more. By the end of that time, if such practice were not squelched, there is no telling but that new and later patents would be taken out which would again carry the monopoly forward for another term of years.

A sense of common justice will bid the Government to free the mining industry from the shackles of the existing monopoly. Accredited representatives of the Government deliberately fix the price of wheat, of potatoes, of coal, and of copper, and now contemplate the fixing of the price of silver. They should not hesitate to fix reasonable terms of royalty for use of a process, which is of great benefit to the mining industry and which is being held at exorbitant ransom to any one who wishes to use it.

As stated not long ago, the fruits of the intellectual energy directed along this one particular highway of science should be the reward of the discoverer. Screened behind the shield of science which has ever shrouded the inner workings of the M. S. N. A. Corporation, may be considerable intellect or may be profound ignorance in wily retreat feasting upon the brains of the world. The M. S. N. A. Corporation, whether bursting with energy or wallowing in a slough of inertia, by the enforcing of its license in its present form would have an endless chain of useful ideas flowing to its bosom, and to be held at exorbitant ransom to the very men through whose combined energy the complete idea was evolved.

It is from that menace the mining men and metallurgists of Canada demand protection. The writer is not speaking without authority in stating the mine managers, as a body, of the largest precious metal mining camp in the Dominion will refuse to subscribe to any such contract as that embodied in the license of the patent exploiting firm of Minerals Separation North American Corporation. Truly, the situation warrants immediate action by the Canadian Government, not only in the matter of nationality, but also in the matter of terms of royalty and conditions imposed upon the licensees.

The belief is growing, especially in the Cobalt camp, that the terms of royalty will shortly be fixed and the royalty be paid to the Canadian Government to remain in escrow until such time as the stability of the Minerals Separation master patents is proven.

Oxy-Acetylene Welding and Cutting

In estigate the Money-Saving Advantages of This Process

Oxy-Acetylene Welding Outfit Employing Prest-O-Lite ready-made Acetylene and Compressed Oxygen, both in Portable Cylinders.

THERE is practically no line of metal manufacturing of repairing in which oxy-acetylene welding has not already established itself firmly as standard, routine method.

All kinds of metals are welded by the Prest-O-Lite process of oxy-acetylene welding. Valuable castings, and broken machinery parts worth thousands of dollars, are saved and quickly put back into service.

Through avoiding costly tie-ups and delays in production caused by the breakdown of an important machine—or by saving the cost of a new part—one Prest-O-Lite welding repair may save the cost of the entire welding outfit many times over.

If you are interested in making your plant more profitable—in reducing operating costs and effecting many economies in production—if you wish to make your product stronger, neater, better—investigate what Prest-O-Lite Welding will accomplish for you.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow-pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

MINING INVESTMENTS.

It is doubtless lack of information that makes the public so often judge the mining industry from the losses made through gambling in mining stocks. When a man gambles in wheat and loses, he does not blame the agricultural industry. He usually keeps quiet about his losses, but privately he must confess to himself that his losses are due to his own ignorance or inability to properly size up the wheat situation. He should treat the mining industry in the same way.

If a man is heard blaming the mining industry for his losses, he is simply proclaiming to the world that he is a gambler in mining stocks. On enquiry it will usually be found that although he may be a shrewd, careful and successful business man in his own line, when it comes to mining he throws shrewdness and common sense to the winds and ignores usual business methods. Under the circumstances the dice are loaded against

If you wish to invest in the Mining Industry, and not simply to gamble in mining use ordinary business principles and common sense.—A. A. Cole.

What Are You Doing to Increase Your Output For This Year?

When you install a "New Cleveland" Type S Stoper, you are practically doubling the ability of one man, for it does so much more work than others.

But that isn't by any means all. "New Cleveland" Type S Stopers are so ruggedly built that they stay on the job more constantly and cost far less for repairs. They use less air and operate more smoothly than other drills. The speed and power of the blow enables the runner to break previous records.

We guarantee "New Cleverlands" to give you the results in competition with other drills.

Write for Bulletin No. 35-A, which fully describes the "New Cleveland" Type S Stoper.

Orders Indicate Marcy Efficiency

Repeat Orders Prove It !

AN INSTALLATION OF NO. 86 MARCY BALL-MILLS

MARCY MILL

CRUSHING
"ONE
EASY
STEP"

Numerous repeat orders from plants operating Marcy Mills are **definite proof** of the efficiency and splendid results these mills give.

Tests have shown that Marcy Mills have unusually large capacity combined with high mechanical efficiency.

The Marcy Mill is a cylindrical Mill with a discharge grate which causes the discharge of finished products from the mill as fast as they are made. The Marcy Mill in effect dis-

charges at the periphery, and hence we guarantee a high efficiency.

The sturdy construction of Marcy Mills keeps repair costs low. Among the large Marcy users are the following:

Inspiration Consolidated Copper Mining Co.
Kennecott Copper Corporation.
Braden Copper Co.
Magma Copper Co.
Utah Copper Co.
Arizona Copper Co.

Further particulars gladly furnished on request.

The black spot indicates trunnion area—the white circle discharge area of grates in Marcy Mills—ten times trunnion area.

Applicants for publications not listed above should mention the precise area concerning which information is desired.

Maps published within recent years may be had, printed on linen, at the nominal cost of ten cents each.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to The Director, Geological Survey, Ottawa.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

"The Babbitt Metal Without a Fault" is guaranteed to give EXCELLENT SERVICE. It will not crack or squeeze out. It will run cool at any speed. It is copper coated and copper hardened. It is best for all general machinery bearings. Order a box from your dealer or from our nearest factory.

**It is Made in Canada. What We Make We Guarantee.
We Manufacture All Grades of Babbitt Metals.**

Molybdenite From An Ontario Mine

This specimen is from the Taylor mine near Renfrew, now being operated by A. W. Taylor, 123 Bay St., Toronto.

LABOR---SAVING FOR COLLIERIES

With the growing scarcity of workmen, it is imperative to use devices that will save labor and maintain production in every department of coal mining work.

For removing rock in your colliery select
Sullivan "Rotators"

"ROTATORS" are 38-lb., ONE-MAN Hammer Drills, convenient, powerful, rapid. One man and a "ROTATOR" can take up bottom, cut a sump, trim walls, take down top, cut a break through or an overcast about ten times as fast as a hand driller and four to six times as fast as two or three men with power drills on mountings. The "ROTATOR" is driven by a

SULLIVAN "WK2" Air Compressor

mounted on a mine car and motor-driven; maximum efficiency is gained by moving the compressor about the mine with the drill. Hundreds of these Sullivan Portable Drilling Rigs are in use to-day. Why not try one in *your* mine?

LEYNER SHANK AND BIT PUNCH

Leyner Shank and Bit Punch

View showing Rack and Pinion Control Removed

LEYNER SHANK AND BIT PUNCH

As already stated, the operation of the clamping is accomplished through the medium of a rack and pinion, the rack consisting of teeth cut in the top side of the piston rod attached to the clamping piston. As the piston moves in and out, it revolves the pinion which in turn operates the right and left hand ratchet screw opening or closing the jaws of the clamping device as may be.

To prevent dirt or other matter from entering with the admission of air and passing it has been covered by a suitable guard. Further, the protruding end of the rack operates in a suitable groove, eliminating the possibility of the rack being moved or jammed during the operation.

Standard Equipment

The standard equipment consists of the machine complete with punching pin 2" diameter for a distance of 2" is the only the remainder of the pin being 1" diameter. Also includes automatic lubricator, an extension 1/2" pipe to which the air hose is attached. It does not include the air hose. This is extra.

FLOAT FEED

CARBIDE MINE LAMPS

WORK WITHOUT WATCHING

When the flame of a hand regulated lamp gets small the miner either works the raking wire—turns on more water or bumps the lamp against a rock. The first method generates too much gas, the second floods the carbide and the last damages the lamp. The flame of an ITP remains the same size from start to finish of the charge and the proof that the ITP never needs regulating is the simple fact that there is nothing on this lamp which can be regulated.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

Canadian Milk Products Co. Ltd.,
Toronto, Ont.

Gentlemen:—

I have recently been living in Canada at a mining camp where it was impossible to obtain fresh milk, and I used your "Klim" with most satisfactory results. I am now living in the United States, and owing to the present high price of fresh milk, I would like very much to continue the use of "Klim" for cooking purposes. I would be very much obliged if you would let me know whether or not it is possible to obtain "Klim" in the United States and if so I would like to know your nearest agent.

Hoping for a favorable reply, I am,

Very truly yours,
Mrs. _____

Ask your Supply House about KLIM. You will find it the most economical and satisfactory milk for use in camps or on prospecting trips.

In fixing prices of metals and ores in the United States the producers and the Government have carefully considered costs and needs. In fixing the price of molybdenite in Canada, Canadian producers and would-be producers received no consideration. The price was arbitrarily fixed in England, and our Government until last week showed no disposition to free itself from outside dictation. By putting on an embargo without insisting on a fair price, it met the wishes of the British users of molybdenite and then allowed the Imperial Munitions Board to dictate prices to producers. Everyone is pleased to see the British Government obtain its supplies as cheaply as possible; but it was absurd to expect that the producers should not object to the fixing of prices without consideration of the cost.

The recent decision of the Canadian Government is to be regarded as a hopeful sign. It suggests to us that the folly of discouraging the producer of basic materials is becoming more generally recognized.

THE MOLYBDENITE EMBARGO LIFTED.

The Dominion Government is to be congratulated on its decision to remove the embargo on molybdenite. As we have repeatedly pointed out during the past few months, this embargo has seriously interfered with the development of molybdenite deposits in Canada at a time when there is an excellent opportunity to market this mineral.

Early in the war the British Government fixed the price of molybdenite in Great Britain, and appointed brokers to requisition, at a price of 105 shillings per unit, all shipments arriving in the United Kingdom. The demand for molybdenum naturally rose rapidly with the increased use of molybdenum steel, and the ruling price in the United States is about double that in England. Development of molybdenite deposits in Canada has been given a great impetus by the war; but the placing of an embargo on shipments to the United States forced Canadian producers to depend almost entirely on purchases by the Imperial Munitions Board at a price fixed by the British Government. By this stupid arrangement, which saved the British Government only a paltry sum because its needs were small, Canada was prevented from marketing molybdenite at a good price in the United States; and development of Canadian molybdenite properties has been greatly delayed.

The price paid by the Imperial Munitions Board is not sufficient to pay the cost of mining and concentrating molybdenite at many mines, if any, in Canada; and unfortunately it will now be some time before full advantage can be taken to supply the demands of United States and European manufacturers. It is to be regretted that the embargo was not lifted last spring, as mining could have been carried on more energetically if the action of the Government had not been so discouraging to producers. The few companies which are now in a position to produce molybdenite will, however, be able to take some advantage of the new conditions, and those who have been disheartened by Government interference will now resume their work of development with new courage.

In view of the fact that the prices of many metals have been fixed by Governments, it is not surprising that the price of molybdenite should be fixed. We have no objection to the fixing of a price if it is done by Canadians after careful investigation of the cost of producing the mineral at our low grade undeveloped or partially developed deposits. We do object to the fixing of a price without investigation. The demand for molybdenite before the war was small; but it has so greatly increased that development of low grade and irregular deposits is necessary. The cost of mining such material is necessarily high and should be taken into consideration. Experience in the United States has shown that not enough molybdenite is obtainable when the market price has been over \$2 per lb. With the embargo lifted and Canadian deposits worked, it is probable that a fixed price of \$2 per pound would result in enough molybdenite being mined to meet the demand. It would be an easy matter for the United States and Canadian Governments to agree on a price such as has obtained in England, but such a price makes development of most molybdenite deposits impossible.

A SHIPMENT FROM TAYLOR MOLYBDENITE MINE.

During the past summer, Mr. A. W. Taylor of Toronto has been developing a molybdenite property near Renfrew, Ontario. Recently he shipped to the Mines Branch, Ottawa 42,584 lbs. of ore which averaged 3.4 per cent. MoS_2 , or 1447.88 lbs. On a basis of 92 per cent. recovery the MoS_2 content amounted to 1332.04 lbs.

The flake molybdenite, shipped to another destination, averaged over 65 per cent. MoS_2 . The combined shipment contained over 4 per cent. MoS_2 .

Owing to the severe weather, work at the property is temporarily discontinued. The satisfactory results obtained in the preliminary work indicate that the property will soon become an important producer.

THE EXPORT OF MOLYBDENITE.

The Canadian Government has decided to license until further notice the free export of molybdenum, tungsten, their ores, concentrates and products to approved consignees in the United States and France. It is necessary for exporter to obtain license from Commission of Customs, Ottawa, previous to shipment and from the Bureau of Imports, War Trade Board, Bond Bldg., Washington, a license to import into the United States.

USES OF MOLYBDENUM

At a meeting of the New York section of the American Institute of Mining Engineers held on Sept. 27, 1917, the following comments on molybdenum were presented in a paper prepared by S. H. Ball and published in a recent bulletin of the A. I. M. E.

Molybdenum perhaps more than any other metal has had its production increased by the war. The 1916 production was in tonnage over twenty times, and in value perhaps 100 times, that of 1902. Its use for munitions prior to the war is shown by the fact that the principal consumers prior to 1914 were Krupp and Creusot. The 3 or 4 per cent. of molybdenum used by the Germans in their heavy artillery, and even in rifle barrels, notably prolongs the life of these weapons.

The most important use of molybdenum in peace time is in steel and other alloys. Its consumption in tool steel appears to be at a standstill, but many feel that in this field the metal has not as yet had its final trial. The use of alloys containing molybdenum in automobile parts is increasing. The metal is also employed in small quantities by the electrical and scientific instrument trades. Its salts figure as chemical reagents, pottery colorants and medicines. A salt of molybdenum is used as an explosive preservative.

It is hoped that the war will prove to the steel workers the valuable properties of the metal, and by creating a demand for it, develop dependable sources and stabilize the supply. Tungsten, its chief competitor, has in the past enjoyed the advantage of a much better established production.

The position of being the chief molybdenum producer has changed with remarkable frequency recently. In 1910 Queensland accounted for 50 per cent. of the production, New South Wales and Norway each almost 25 per cent., and Sweden and the United States produced small amounts. Active prospecting, fostered by

war prices, caused the United States to take the lead in 1915, but this year Canada is apparently the most important producer. According to Mr. F. L. Hess, the world's 1915 production was equivalent to 222.6 tons of metal.

Prior to the war France and Germany produced most of the ore, but now England, Canada and America are also making both molybdenum and ferromolybdenum.

The metal 6 years ago was worth about \$1.40 per pound, but since 1914 has been from double to quadruple this figure. The price of ferromolybdenum (containing from 50 per cent. to 85 per cent. molybdenum) is practically that of its molybdenum content.

There are two molybdenum materials occurring in minable quantities, molybdenite, the sulphides, and wulfenite, lead molybdate.

Molybdenite, the most important of these, on cursory examination resembles graphite. It is usually associated with rocks of the granite family. Tungsten deposits, and quartz-molybdenite veins, have to date yielded over three-fourths of the world's production, while pegmatites, tin and bismuth deposits and cupriferous quartz veins have added small amounts. Certain molybdenite-bearing granites might be the basis of large milling operations if the demand for the metal justified the necessary expenditure.

Molybdenite prices are quoted on a 90 per cent. MoS_2 product, although when stocks are short, 20 per cent. concentrates may be saleable. Copper should be below 2 per cent. or 3 per cent., and tin and bismuth less than 0.5 per cent. A number of other impurities are penalized. From 1902 to 1913 the price mounted from \$400 to \$1000 per ton, but since the war it has fluctuated between \$2000 and \$3600. All British production is commandeered at \$22.50 per unit.

Wulfenite is rather common in the oxidized zone of lead-bearing ore bodies, particularly in arid regions. Although it is a less desirable ore than molybdenite, it was practically the only molybdenum ore produced in America prior to 1915. Since the war Wulfenite containing 25 per cent. molybdic trioxide has been worth some \$300 per ton.

It is hoped that when peace arrives the steel workers will have satisfactorily proved the value of the metal, and that its production will increase. It is at least as common in the world's crust as tungsten, and I am inclined to believe that, while its high grade deposits are pockety, low-grade deposits of considerable tonnage exist which will insure a supply of the metal long after the important tungsten producing centres, now known, are exhausted.

OXY-ACETYLENE WELDING.

"Turning waste into profit" is the title of a booklet, recently issued by the Prest-O-Lite Co., Inc., Toronto, dealing with the importance of the conservation of steel and iron through oxy-acetylene welding and cutting. This booklet is profusely illustrated with half-tone engravings showing many examples of Prest-O-Lite welding repairs, which have saved money for manufacturers, railroads, mines, machine shops, engineering and industrial plants in almost every line. We have been advised by the Prest-O-Lite Company that a copy of this booklet will be mailed free of charge to anyone interested.

Bore-Hole Exploration

By C. H. Hitchcock.

The mining business may be divided into four lines of work, prospecting, exploration, mining and metallurgy. Each of these involves many of the sciences and many lines of engineering. In such a business certain branches of the work are more attractive than others and become very highly developed. Those that are less scientifically conducted cause a weakening of the whole structure.

Prospecting is a game of chance, and no matter how well it is conducted, the net result is not to eliminate the gamble but lessen it.

Exploration to-day is probably the weakest link in the mining business, and poor work along this line is yearly the cause of monumental blunders.

As soon as an area of land is chosen as having mineral possibilities scientific exploration is reasonably sure of determining the structure, quantity, and quality of such minerals as may exist. This data is fundamental and should decide how extensive a mining business, if any, can be established to ensure a maximum of profit.

In general the objects of scientific exploration are three fold; to establish ore reserves as a foundation to finance the business; to develop the structure of the orebody so that the mining can be done on the proper scale, and at a minimum expense; to prove quality of the ore so that the metallurgy will be scientifically worked out and a treatment plant built in keeping with the size of the orebody. We want nicety of adjustment of one branch of the work to every other. To get this, reliable exploration data is fundamental and absolutely necessary. Otherwise mistakes are sure to delay and lessen the total dividends. Since a thorough knowledge of ore reserves is of such vital importance, it might be expected that great care would be given exploratory work. Actually it is apt to be poorly done by the best mining companies. It is to be regretted that a mining company seldom realizes what it has missed.

Exploratory work may be done by bore-holes; by shafts, drifts and crosscuts; or a combination of the two methods. Bore-hole exploration is by far the cheapest and can generally be used in preference to the latter methods.

In order to successfully explore mineral lands, it is necessary that an engineer who knows structural geology and exploration methods be given time to thoroughly study the type of ore deposit to be explored before starting actual work. If possible, diamond drill exploration should be chosen because it is the cheapest method, proves tonnage the quickest and gives the maximum of structural information.

The rectangular system of drill holes is likely to be best. The size of the squares to govern the position of the holes depends on several factors, namely: the size of the deposit, the character of the mineralization, the depth of the holes, and the character of the rock to be drilled. A large area of ore outcrop of even mineralization and regular outline will stand large squares, while small deposits of uneven mineralization and irregular outline require smaller squares, necessitating a greater footage drilled to get reliable data. Exploration requiring deep holes demands large squares because of the deflection of the holes, otherwise the holes will cross and one will thereby

become of little value. Holes drilled in brecciated, broken material, rocks of unequal hardness and sediments, deflect greatly, and for the same reason require larger squares.

The angle of the holes should be tested at regular intervals from the surface in order to secure accuracy. E. J. Longyear Company, 710 Securities Bank Building, Minneapolis, Minn., can furnish complete apparatus for this work.

The Knight and Stone core barrel is considered the best double tube core barrel on the market and is supposed to give a maximum recovery of core in soft ground. Large rods extracting a large core will generally give a better recovery of core and may insure straighter holes.

All cores must be carefully studied and the relative ages of the formations determined. Failure to do this has caused irreparable blunders. The core requires assay of economic metals contained as well as those elements that may have a bearing on the metallurgy of the ore. The metallurgical side is too often neglected.

When the orebody is surrounded by barren holes the deposit may be considered thoroughly explored. The quantity and quality make it possible to decide intelligently regarding future financing, mine development, and the metallurgy of the ore. All work such as mine development, treatment plant, townsite, etc., can go ahead at the same time. In this way maximum production will be reached in the shortest time, at the least total expense, and give the maximum of dividends when the ore body is exhausted.

The Appeal Tribunal at Sudbury presided over by The Hon. Mr. Justice Ferguson, decided on December 28th, 1917, that exploratory work was unnecessary for the duration of the war. As a result ten skilled diamond drill runners are liable to military service. These men cannot be replaced, so that a large part of the exploratory work during 1918, if done at all, will have to be done by the very expensive and tedious method of sinking shafts, driving drifts and crosscuts, utilizing many times the number of men.

OBITUARY

Mr. Wm. Rowe, for a considerable part of the last twenty years engaged in mining in British Columbia, died suddenly in Nelson, West Kootenay, B. C., on the night of December 24, in his 54th year. He was born in Cornwall, England, and came to Canada about twenty-two years ago. He was in charge of the B. C. mine, in Boundary district in the late nineties and, too, when, in 1900, about 20,000 tons of copper ore averaging about 5 per cent. copper, was shipped to the smeltery at Trail, 4,000 tons of which was the first important shipment of copper ore in the Boundary district. In later years he supervised development work on some valuable coal lands in the Blairmore-Frank district of Southwest Alberta. After that he was for several years superintendent of the Jewel gold mine, in Greenwood mining division, Boundary district. He was one of a number of thoroughly good Cornish miners who assisted appreciably in developing mines in Boundary and Kootenay districts of British Columbia.

The Development of the Ankerite Gold Mine

By Clifford E. Smith.

The following is a brief summary of the operations of the Coniagas Mines, Ltd., in the Porcupine Mining division, as contained in a report to the directors:

Operations have consisted of examination of gold prospects, exploration of properties held under option of purchase and of properties acquired by purchase and general organization for the development of gold deposits indicated by such exploratory work. Examination of Ontario gold prospects had been conducted by the directors of the company for some time previous to October, 1915, but of the prospects offered and examined prior to that time, none was deemed of sufficient promise to command the attention of the company.

During October, 1915, preliminary examination was made of a group of three mining claims known as the Ankerite property, situated in Deloro Township and about four miles south-westward from the town of South Porcupine. Results of this examination indicated the possible existence of gold deposits of more than ordinary promise and the directors of the Coniagas Mines, Ltd., decided to explore this property, subject to a satisfactory option of purchase from the owners. Negotiations for a suitable agreement were concluded successfully during the following winter, and prospecting work was begun in April, 1916, and was continuous until April, 1917, during which period of free option a systematic exploration was made of a part of one of the three claims, known as claim M.E. 61.

This work was confined to a zone in which a vein system was indicated. By an extended series of cross-sections of this zone, made by surface cross-trenching and cutting, underground cross-cutting and diamond-drilling, this vein-system was defined as continuous for a length of approximately 1,500 ft. across claim M. E. 61. Systematic sampling followed each cross-section of the several veins and assay results of each section were satisfactory, showing more than ordinary widths and continuity of commercial gold values. This plan of exploration was completed in April, 1917, permitting then a correlation of all results and reasonably safe conclusions respecting the promise of the property. The directors were then advised that they were justified in making the small preliminary payment due that month toward purchase and in undertaking a systematic development of the deposits along the lines which this exploratory work had indicated.

During this first period of work it was found that the vein-system under exploration extended westward from the Ankerite property for some undefined distance across an adjoining group of two claims known as the Maidens-McDonald property. Having evidence that such extensions would prove of value as adjuncts, negotiation for purchase was begun with the owners, and on August 9th, 1917, an option of purchase was concluded, at a price considered safe and reasonable. This option has since been exercised.

Development work decided for the Ankerite was deferred pending these negotiations, so that location of the first working shaft could be determined accordingly. Upon completion of this option, work was resumed under a general plan of development and exploration combining the prospects of both groups and is being pushed as vigorously as working conditions will permit.

This second period of exploration of the Ankerite is producing further satisfactory results, prospects, both of deposits and net values, being extended considerably. Our earlier opinion has been confirmed, that at the eastern boundary of the Ankerite claims the general system of fissuring swings from a north-east strike back sharply toward the north-west, following the swinging brow of elevated country and remaining well within the Ankerite boundaries. This set of conditions appears to preserve within the Ankerite eastern boundaries, both on strike and dip, the major possibilities of Ankerite vein-systems.

On the Maidens-McDonald property, exploration is being extended westward from the Ankerite boundary. This work is following new lines and is defining important extensions and values.

A new power plant has been installed on claim M. E. 61 and is now in operation, serving power for shaft sinking and electric lighting of general buildings. This plant consists of a boiler of 150 H.P. capacity, a "6 drill" air compressor, hoisting engine with drum capacity for 800 ft. depth, engine and generator for 185 lights of 40 W. each, Leyner No. 5 drill sharpener, and general equipment complete for efficiency.

In acquiring the Maidens-McDonald property a power-plant already installed thereon was purchased. This consists of two boilers of about 40 H.P. capacity each, and a "6 drill" unit of a "12 drill" compressor, the other unit to be installed. This plant was put in order and air connections made with the new plant on M. E. 61, so both plants may be used for operations, or one as a reserve for the other.

There is abundance of wood on the properties for over one year of requirements, and this is used as fuel, the cutting serving the double purpose of supplying fuel at a relative cost of less than one-half that of coal and of clearing the ground against risk from fires.

When this fuel has become exhausted and development has exceeded the capacity of these steam plants, electrical power will have been installed suited to extended working requirements.

Camp buildings have been constructed and equipped with capacity for about 75 workmen. The shaft-sinking crew comprises about 35 men, and about 25 more workmen are now employed in operations.

A vertical shaft is now being sunk on M.E. 61, located for development and working of sections of M.E.61 and H. R. 832 (of the Maidens-McDonald group). This shaft is designed for both development and producing purposes and consists of three compartments, each 5 ft. x 5 ft. inside timbers. From this, at proper levels, stations will be cut and cross-cuts of the vein series made as sinking advances, from which development of deposits will follow.

During the coming fiscal year of your company a very considerable underground development and determination of deposits should be accomplished.

Published comment in Spokane, Washington, relative to the Slocan Co.'s affairs is that it begins to look as if a receiver's sale will be necessary, in which event it may be possible that some scheme will be worked out by the White interests whereby the property will be transferred free of debt to a new corporation in which all shareholders in the present company who shall see fit to participate will be allowed to do so.

CONSOLIDATED. M. AND S. CO.

W. D. Matthews, president of the Consolidated Mining and Smelting Company of Canada, in the report, dated December 28th, of the operation of the Company for the year ending September 30th, 1917, said:

The net profit is \$1,076,828 after writing off \$648,058 for depreciation of plant and equipment and charging Profit and Loss Account with \$380,071 in development of the properties. The balance at the credit of Profit and Loss Account now stands at \$2,360,274.

Operations at the smelter, refineries and mines have been handicapped during the year by strikes, causing a serious shortage of coal, which resulted in the discontinuance for some time of shipments of ore from the Rossland mines and a curtailment of ore shipments from other properties.

Labor conditions have been unsettled and difficult during the year and finally resulted after the close of the year in a general strike of the men employed in the smelter at Trail, and a complete cessation of the operations of the company. This strike has within the past few days been settled and the plants and properties will recommence operations immediately.

Notwithstanding all the difficulties encountered during the year, the value of the season's metal product exceeded \$13,000,000.

Producing Sixty Tons Zinc Daily.

Managing Director J. J. Warren says:

The electrolytic zinc plant was completed during the year. Various improvements were made in the process and more are under consideration. A daily production of over 60 tons of pure zinc was reached. An extraction of over 90 per cent. was made from certain classes of ore. Now that the process may be considered to be standardized, every effort is being made to reduce the cost of production. So far there has been no difficulty in disposing of the entire output. The year's production of 10,000 tons of pure zinc, of a value of \$3,000,000, marks another epoch in the metallurgical history of Canada. A concentrating mill with a capacity of 400 tons of ore per day has been erected to treat the Sullivan zinc ores prior to their being put through the zinc plant proper. It has been demonstrated that a much higher extraction can thus be made and at a moderate cost.

Produced 22,000 Tons Refined Lead.

The production of refined lead amounted to over 22,000 tons—or more than 2,000 tons in excess of the product of the previous year. About 75 per cent. of this was sold to the Imperial Munitions Board.

The metallurgical results were the best in recent years.

The production of gold was less than in the previous year because of the Rossland mines having been operated only about half the year.

The production of silver was greater than in the previous year because of the higher silver content in the lead ores received.

Sulphuric Acid Plant Doubled.

The sulphuric acid plant was doubled in capacity. After supplying the entire needs of the refineries and the zinc plant, there is a surplus product for sale commercially.

The hydrofluosilicic acid plant provides the entire requirements of the lead refinery.

Unsatisfactory Operating Conditions.

Operating conditions during the year were unsatisfactory. Supplies of all kinds increased in price. La-

bor, in addition to demanding (and receiving) a higher wage scale, showed a marked decrease in efficiency.

The production of the Rossland mines was only about one-third of normal. This reduced profits and increased operating costs. The Sullivan mine maintained its position as the largest producer.

The statement of the West Kootenay Power and Light Company shows satisfactory earnings. For the most part these represent revenue from electric energy supplied the parent company. The power company has contracted with the Northport Smelting and Refining Company to supply a maximum of 1,500 horsepower for a term of years and with the Canada Copper Corporation to supply a maximum of 5,000 horse-power for ten years. The rates obtained are satisfactory and insure substantial additions to the earnings of the company. A transmission line is being extended to the works of the Northport company. The necessary steps are being taken to extend another transmission line from Greenwood to Princeton and Copper Mountain, where the works of the Canada Copper Corporation are situated.

The value of the year's metal product—over thirteen million dollars—is the greatest, by far, in the history of the company.

Acquiring Gold Properties.

A policy of acquiring and developing gold ore properties is being pursued, to provide against the possibility of a decline in the demand for base metals after the war.

The Canadian commercial requirements for base metals having slackened very considerably during the war, the Imperial Munitions Board have absorbed the bulk of the production. The Board are very keen buyers. Recently they have required that the prices current in the United States markets be met by the company—except for a fair allowance in the matter of freight charges.

Duty on Machinery Increases Cost of Mining.

The cost of production in Canada is necessarily higher than in the United States on account of the more refractory character of the ores treated and the smaller size of the operations. Besides, all supplies used in connection with Canadian mining, smelting and refining cost about forty per cent. more than the same supplies in the United States, the Canadian price being practically the United States price plus the duty into Canada.

This operates as a hardship on the Canadian production of metals when they have to be sold at the United States prices. If the Company's sales to the Imperial Munitions Board had been made at the Canadian commercial prices of the day—instead of the United States prices of the day—the difference in the net profits would be very substantial.

It is hoped that in the future the Board will take a more favorable view of the conditions under which metals are produced in Canada.

Early in 1917 Mr. R. H. Stewart left the service of the company to engage in consulting and other engineering work in Vancouver.

On July 1st, Mr. F. N. Flynn became General Superintendent of Smelting and Refining. From that date, Mr. E. H. Hamilton devoted his entire attention to the zinc plant.

The selling organization, in charge of Mr. W. S. Rugh, west of the Province of Quebec, and of Thomas Robertson and Co., Limited, east of the Province of Ontario, gave satisfactory results.

Recent Industrial Uses of Aluminum*

By F. G. Shull.

In preparing a paper on this subject I have chosen to refer to the following materials, practically all of which have reached stages of commercial importance during quite recent years: Aluminum foil. Aluminum bottle caps and jar closures. Manufactures, involving autogenous welding. Die and pressed castings. Tubing for store service. Rolled rod for machinery purposes. Aluminum conductors, steel reinforced.

The aluminum foil industry has grown from practically nothing to a volume of business involving many tons of aluminum annually. At the start, the product consisted principally of plain foil, not appreciably unlike plain tin foil in appearance, which was used for wrapping candies, chewing gum, teas and the like. Later on the development of the process for embossing and printing aluminum foil opened up a field among manufacturers of chocolate bars, cheese, toilet soaps, etc., so that to-day a very considerable tonnage of this foil is being used in the embossed and printed form.

Plain foil is being used to some extent in electrical condensers. A most recent use for plain foil, which has, as yet, just barely started, is for the lining of pulp board cartons for the packaging of coffee. This combination package possesses moisture resisting, and oil retaining characteristics not inferior to the tin can, as a coffee container.

Aluminum bottle caps and jar closures on the market, known as the "Goldy" seal, have, like foil, advanced from a meager beginning to a business of substantial proportions during a very few years. They are being used on practically all food products put up in glass, such as grape juice, fruits, preserves, ketchup, pickles, salad dressing and so on. While this seal possesses the non-refillable feature and requires no opener to remove, it owes its success, in a great degree, to the fact that it is aluminum, which is known to be non-rusting and strictly hygienic.

The development of a process of welding aluminum by means of the oxy-hydrogen and oxy-acetylene flame has opened an almost limitless field for the outlet of aluminum. Sheet aluminum of all gauges heavier than about one-thirty-second of an inch can be readily welded and the seam dressed off so that it is difficult to locate the joint. Consequently it is possible to build up an aluminum tank or container of almost any size and shape which, when welded together, is practically a one-piece job. This class of material finds a place in breweries, ginger-ale plants, milk depots, chemical plants, and, in fact, wherever seamless metallic non-rusting containers are wanted. The one-piece feature is of marked advantage over the riveted tank which is always liable to spring a leak.

For a long time it has been considered a difficult proposition to die-cast aluminum. At the present time, however, this problem seems to have been solved, as there are several companies that claim to be successfully die-casting this metal.

Another quite recent development is the subjecting of sand castings to very high pressures in order to render the metal more dense and to increase the

strength. Such castings have found use in the making of parts for the timing devices of shrapnel, it being found that these castings not only possess extra high strength, but that they also machine exceptionally well.

Aluminum tubing for pneumatic store service is not a new field for aluminum, strictly speaking, since it has been gradually coming into use for the past several years. It is a fact, however, that the last few years have seen the volume of aluminum consumed for this purpose reach a stage where the tonnage involved is of very great importance. The natural characteristics of the metal itself principally recommend it for this use.

One of the most interesting developments in the aluminum industry of recent years is the rolling of high alloy rods in practically all commercial sizes. In the past, commercial aluminum rod has been largely a drawn product. This method of manufacture prevented the use of aluminum alloyed with any appreciable percentage of other metal, for the reason that in the drawing operation the surface, principally, of the rod is worked. The result is that the surface becomes hard while the body of the rod is left comparatively soft. Therefore, only the smaller sizes of drawn rod are suitable for machining.

By the rolled method of manufacture not only is it possible to use highly alloyed metal, but also the process tends to work the entire mass of the rod so that the finished product is a good uniform homogeneous material which machines well throughout its entire substance. This process, therefore, makes available a good machining aluminum rod in all commercial sizes for automatic machine and turret lathe products.

One of the first uses for which this rolled rod was tried was for the machining of the fuse-timing parts for shrapnel. While it worked perfectly for this purpose, it so happened that the principal timing parts were of such a shape that in making them from rod it was necessary to cut away a great deal of the metal, resulting in high scrap loss. It was found that sand castings of the general shape of the parts to be made could be subjected to a compression process and rendered highly satisfactory for this purpose, with a minimum of scrap loss. Consequently, as a commercial proposition, the rolled rod could not compete with the compressed castings for this particular article. It will without doubt, however, find wide usage for automatic machine products.

Aluminum cable, steel reinforced, is not a very recent aluminum product, it having been in commercial use on an extensive scale for the past few years. It is, however, sufficiently little understood to seem to warrant reference being made to it under the title of this paper.

The excuse for the existence of such a product as steel reinforced aluminum cables lies in certain inherent characteristics of aluminum which needed improving in order to recommend its use for long span, high voltage work. The particular characteristic to which I refer is the coefficient of expansion of aluminum, which is approximately one-third greater than that of copper. Due to this greater expansion the aluminum line lengthens a little more with temperature rise, and shortens a little more with temperature fall, than copper. The result is that it is necessary to string aluminum wire with greater sags than copper wire, in order that its strength may not be overtaxed at low

*A paper presented at a meeting of the American Institute of Metals.

temperatures. By allowing this greater sag at ordinary temperatures, combined with the higher coefficient of expansion of the aluminum referred to, one is apt to get excessive sags at extremely high temperatures in summer.

This was a condition of comparatively little importance in the early days of low voltages and short spans, but with the advent of higher voltages and long span, steel tower construction, the characteristics of aluminum cable, as referred to above, became a serious menace to its commercial existence.

What aluminum cable lacked was high tensile strength and low coefficient of expansion. In order to impart these characteristics it was proposed to make the centre strand of a seven-strand cable, of steel, and the six outer strands, of aluminum, the steel to furnish the strength, and the aluminum the electrical conductivity. A very high grade plow steel wire was selected, which was triple galvanized to prevent corrosion, and the practical tests which followed proved that the theory was correct; that the composite cable took on characteristics different from either of the component metals, and was highly satisfactory for long span work.

It is found feasible to construct these cables with any standard number of strands, varying the proportion of steel and aluminum to meet the particular strength and sag conditions required.

Aluminum cable, steel reinforced, began to grow in favor from the start, so that to-day many of the most modern transmission lines on the American continent are built with this cable.

This, in a general way, will give a hint as to some of the more recent uses of aluminum. The automobile industry is, of course, the big factor in the aluminum business to-day, but the relative importance of some of the other fields for this metal seem to be greatly on the increase.

Mr. J. A. Macpherson, manager of the Cariboo-Chisholm Creek Mining Company, in which it is understood Toronto men are interested, has been quoted by the Cariboo Observer as having stated that the tunnel on the Company's property on Chisholm Creek, Cariboo, crosscutting the channel, is about two-thirds in gravel, with something like two feet of bedrock in the bottom. The gravel looks well; red, rusty looking stuff, and is well washed. The bedrock, unfortunately, is soft, and, the Observer remarks, although it is not known except to the management, what value it contains, not much can be expected until there shall have been a change, which may happen in a set or two, after drifting up-stream shall have been undertaken.

A Northwestern copper-mine manager has been quoted as having stated recently, in order to show what the copper-mining companies "are up against," that after careful investigation he has found that: Cost of wages at present, as compared with the average of 1915, shows an increase of 35 per cent.; cost of supplies, an increase of 45 per cent. Labor efficiency has at the same time had a tremendous diminution as shown by the fact that the average number of tons per man per shift now as compared to 1915 shows a decrease of 35 per cent. Under these circumstances the present selling price of copper can hardly be more advantageous to the copper companies than would be a price of 15 or 16 cents with pre-war costs.

THE LEAD-ORE SITUATION IN BRITISH COLUMBIA.

Following the settlement of the strike of its employees at Trail, British Columbia, the Consolidated Mining and Smelting Company of Canada, Ltd., invited the lead-ore producers of Kootenay district to meet its officials in conference relative to the present situation in regard to the disposal of lead ores. The meeting was held in Nelson on Dec. 27, and the Daily News, of that city, gave the following account of the proceedings:

The crux of the situation is that the Imperial Munitions Board is unable to place any more lead orders at the present time, though an early improvement in the situation is expected.

Most of the lead producers of the Kootenay lead district were in attendance, but the Slocan mine owners were unable to attend owing to train service being interrupted.

The Consolidated Company officials, after the lack of market had been thoroughly discussed, were asked what the company could do.

They stated that they could not receive any lead ore until Feb. 1. It will take until that time to get rid of the accumulation which resulted from the recent strike at the smelting works and refineries at Trail. Two hundred carloads of ore were unloaded by the office staff of the company after the smelter men went out. After Feb. 1, the officials stated, the smelter could take each month until further notice one-twelfth of 25 per cent. of the production of the mines for the year ending Sept. 30, 1917, and settle for it on the terms of the "pooling" circular of Nov. 5. From the same date, Feb. 1, the smelter could receive each month one-twelfth of the remaining 75 per cent. of last year's production and settle for the silver contents on the terms of the circular of Nov. 5, but the lead contents would have to be stored and settled for only after the lead now on hand had been sold and the lead contents of the 25 per cent. of new ore disposed of.

It was intimated that probably arrangements could be made with the banks to advance against the lead stored sufficient to enable the properties to continue operations. The company stated that it would do everything possible to facilitate such an arrangement with the banks.

The company agreed to continue to limit shipments from its own mines in the same proportion as the shipments from the independent producers were limited.

As to zinc, the smelter company expects to be able to receive normal quantities of ore during February. After that month receipts will depend upon further orders being received from the Imperial Munitions Board.

The question of the receipt of shipments of ore from the Electric Point Mine in the neighboring State of Washington, was mentioned and the officials of the company explained that the ore was necessary for fluxing purposes and was accepted only in sufficient proportion to flux the ores from the properties on this side. The company could refuse to accept ore from this mine but the effect would be to increase the cost of smelting the British Columbia ores. The British Columbia mines, if this were done, would thus be burdened with the extra cost.

Officials of the company present at the conference were: Messrs. J. J. Warren, managing director; S. G. Blaylock, assistant manager, and T. W. Bingay, controller.

War Minerals*.

By A. G. White.

From the standpoint of essential use and importance, the two great basic materials necessary for the production of modern high-power explosives are nitrate, chiefly in the form of nitric acid, and concentrated sulphuric acid produced from pyrite, sulphur or smelter fumes. In the manufacture of this acid, platinum is essential for the contact process of producing sulphuric acid and for a possible similar use in the oxidation of ammonia to nitric acid. Mercury is essential as the material used for explosives and war munitions, for detonating practically all high-power explosives.

As a second group of minerals for military purposes, come the minerals for munitions and military equipment. Of these the chief group is formed of the steel alloys, which are small amounts of the rarer metals added to our iron and steel products to give them absolutely essential qualities particularly required in munitions, ordnance, battleships, machine tools, aeroplanes and automobiles. Of these the most important are manganese, tungsten, chromium, nickel, cobalt, molybdenum, vanadium and uranium. The major metals, iron, copper, lead and zinc, represent materials of which we have produced a very large percentage of the world's supply. The problems in those minerals are quite large, involving transportation and labor supply, but not requiring new research work or the stimulation of small and unknown deposits. In this second general group come aluminum, which is largely used for automobile and aeroplane parts; antimony, which is used as an alloy for hardening lead bullets; and magnesium, which is used in shells for smoke and light purposes, to detect the point at which they burst.

Another group of minerals essential to industry includes particularly agricultural fertilizers. Potash and phosphates, which are used chiefly for fertilizers, are in this group. Then comes a group of miscellaneous minerals: tin, which is used in food containers; flake graphite, which is used for crucibles for steel, brass, bronze, etc., and is essential in metallurgy; mica, which is used as an insulating material for electrical apparatus and particularly as a transparent material in the construction of gas masks and in the automobile service; asbestos, which is used for fireproofing, ship construction, etc.; magnesite, which is used in the construction of refractory brick in many metallurgical furnaces.

The final group represents the large fuel group, coal, coke, petroleum and natural gas, and those again fall into the large group of materials which represent specific problems of transportation, labor supply, etc.

Mr. A. L. Smith, of Alberni, Vancouver Island, B. C., has informed the Daily Colonist of Victoria, that he has discovered nickel-bearing pyrrhotite on some mineral claims on Barkly Sound, V. I. He states that a sample assayed at the Provincial Government assay office, Victoria, gave a return of 1.5 per cent. nickel (metallic), and two samples assayed by the Canada Department of Mines, Ottawa, gave, respectively, 2.32 and 2.48 per cent. nickel (metallic). Mr. Smith added that "the contact vein is the oldest of rock formations and can be traced on the surface 1,900 feet through the claims. The nickel-bearing pyrrhotite is easily distinguished from the pyrrhotite which does not contain nickel."

*Extract from an address before the St. Louis Meeting of the American Institute of Mining Engineers.

NEW PLANT AT TRAIL, B. C.

Mr. E. H. Hamilton, Metallurgical Manager of Consolidated Mining and Smelting Company of Canada, summarizes additions made to the plant during the first six months of 1917 as follows:

Lead Plant.

The new ore bedding system was completed and put into operation, affording two large beds for mixing and storing unroasted ore.

Lead Mill—Improved facilities were provided for crushing ore.

Dwight-Lloyd Roasting Plant—A new unit was started on June 24th with a view to ultimately adopting double sintering.

Silver Refinery.

A flue gas scrubber was installed to recover values previously lost in smoke.

A smelting retort was installed in place of the old type reverberatory furnace for treatment of refined silver.

The new Bluestone Plant was put into operation.

Electrolytic Copper Refinery.

The capacity of the Copper Refinery was doubled. New air lifts were installed for circulating electrolyte. New slime launders installed.

Copper Melting and Casting Department—Furnace and casting facilities were rebuilt and remodelled to double last year's casting capacity.

Sulphuric Acid Plant.

During the year 2872.7 tons of 100 per cent. Sulphuric Acid were produced.

The capacity of the plant was doubled, and is now capable of producing 30 tons of chamber acid per day.

Hydrofluosilicic Acid Plant.*

During the year 196 tons of 100 per cent. Hydrofluosilicic Acid were produced.

The installation of two new retorts is well under way. This will double the capacity of the plant.

Zinc Plant.

The following additions were made to the plant during the year:

Grinding Department—One ore drying rotary kiln has been installed, also other improvements.

A new tube mill has been added to the equipment.

Roasting Department—Four new Wedge-Roasters have been completed, making 13 in all.

Two roasters have been altered and equipped for use as preliminary roasters for the flotation concentrator.

Two Concrete Storage Bins with a capacity of 1,000 tons of Calcine have been built, also screw conveyors, a pumping station, pump, etc., to handle the calcine from these bins.

A link belt steel cased elevator was built and used for calcine.

Leaching Department—During the year the improved counter current system was completely installed and put into operation.

The following additions were made to the plant: 5 new Agitating Pachucas, 3 new Precipitating Pachucas, 10 40-ft. Dorr Thickeners, 4 large Kelley Filter presses bought, installed and operating; 1 large spare Kelley press bought.

Air Lifts—A shaft 75 ft. deep and lagged has been completed, into which 15 air lifts have been installed for handling the acid and other solutions, and thus eliminating pumps. The results have been very satisfactory.

Pumps—Two large bronze Gould Triplex plunger pumps for handling electrolyte have been bought and are operating.

Four Dorr Classifiers have been moved to Pachuca floor.

Two Dorr Classifiers placed over neutral thickeners.

A Diaphragm Pump has been developed and many installed. It is both simple and efficient and without it the counter current system on this class of ore would be impossible.

Two Electrolyte Storage Tanks with capacity of 1,000 tons each were built and put into operation.

Two Lead Lined Acid Electrolyte Storages with capacity of 1,000 tons each were built and put into operation. Lead Linings were put in 8 of the previously installed 16 ft. acid storage tanks. Two 20 ft. storage tanks, one of which is lead-lined, were installed with trestles 40 ft. high.

Elevators—3 elevators for calcine were erected. A Leaching Plant for Customs Ore was built. It consists of 3 Pachuca Tanks; 1 20-ft. Dorr Thickener; 1 Oliver Filter; 3 Concrete Bins; Conveyors and Elevators.

A slimes Filtering Plant with a capacity of 100 tons was built.

Electrolytic Department—Building and Room No. 2 was completed and operated. The whole circulating system of the two tank rooms, including 832 tanks, was reconstructed and greatly improved.

Melting and Casting Department—A new melting furnace was constructed to meet the increased output to 60 tons zinc per day.

Fine Atomizing Apparatus—A small oil fired furnace with oil and air piping, etc., was installed; also an electric furnace for atomizing zinc, also chamber for collecting the zinc and an electrically driven screening system.

A new wash house with shower baths, lockers and room for lunch was built.

Compressor Room—During the year facilities for compressing air were much increased by installing gear drives on the large compressor.

A new high pressure cylinder was added to the Ingersoll-Rand Compressor.

A new high pressure air compressor was bought and installed.

A small air compressor was installed for atomizing zinc.

Generator Room—Seven more motor generator sets were installed, making 13 in all.

A Machine Shop with shafting, lathe, shaper, forge and other tools was installed for quick repairs.

The monthly output of pure zinc has risen during the last six months from 830 tons to 1,322 tons.

The plant is producing, on a commercial scale, Bluestone, Sulphuric Acid, Hydrofluosilicic Acid, Gold, Silver, Copper, Lead and Zinc.

Mr. F. S. Norcross, Jr., for some time superintendent of mines for the British Columbia Copper Co. and the Canada Copper Corporation, was the recipient of a valuable presentation, subscribed for by employees on Christmas Eve at the latter company's big camp at Copper Mountain, Similkameen, the occasion being his enlistment in the Engineering Corps of the United States Army and his consequent intended early departure for the training camp at Petersburg, Virginia. Mr. P. E. Crane, who has been superintendent at the company's Mother Lode mine, near Greenwood, Boundary district, has been transferred to Copper Mountain, to there assume duty in succession to Mr. Norcross.

PERSONAL

Mr. Samuel W. Cohen, General Manager of Crown Reserve Mining Company Limited, has returned to Montreal after a six weeks trip of examination in California and Colorado.

Mr. W. E. Segsworth is in Ottawa.

Mr. George Guess, professor of Metallurgy at the University of Toronto, is perfecting a simple and cheap process of refining nickel.

Mr. C. W. Knight visited the Missouri-Cobalt properties at Frederickton, Missouri, during the holidays. Prof. S. F. Kirkpatrick of Kingston is directing the erection of a plant there for the treatment of ores containing lead, copper, nickel and cobalt.

Prof. J. C. Gwillim has returned to Kingston from Atlantic City and New York.

Prof. S. F. Kirkpatrick has returned to Kingston from Frederickton, Missouri.

Representatives from many of the iron and steel companies were in Ottawa last week.

Mr. F. N. Flynn, who was some years ago at Cobalt, has been appointed general superintendent of the smelting works at Trail of the Consolidated Mining and Smelting Co of Canada.

Mr. Fred T. Greene, Mining Engineer, of Butte, Mont. was killed on Christmas day when a train ran into his auto. He was distributing Christmas presents at the time. Mr. Greene was a graduate of the University of Toronto and of the Michigan College of Mines.

Captain J. J. Johns, shift boss at Murray mine, has been compelled by ill health to resign and go to the southern States.

G. G. S. Lindsey, W. G. Miller, E. P. Mathewson and R. E. Hore of Toronto were in Montreal on Saturday, January 12, to attend a meeting of the Council of the Canadian Mining Institute.

D. B. Dowling and Geo. Mackenzie of Ottawa were in Montreal, Saturday, January 12, attending a meeting of the Council of the Canadian Mining Institute.

A. A. Cole of Cobalt, president of the Canadian Mining Institute, was in Montreal on Saturday for a meeting of the Council.

D. B. Dowling of Ottawa and J. B. Tyrrell of Toronto, have been nominated for the presidency of the Canadian Mining Institute.

J. A. Dresser, H. E. T. Haultain and B. Neilly are nominated as vice-presidents for the Canadian Mining Institute. There are two vacancies owing to the retirement of Chas. Fergie of Montreal and T. W. Gibson of Toronto.

There will be no election for councillors of the Canadian Mining Institute this year.

Mr. W. Lancaster, for a number of years overman at the No. 2 mine of the Crow's Nest Pass Coal Co.'s Coal Creek colliery, was last month presented with a handsome watch, suitably engraved, he having resigned from the company's service on being appointed a district inspector of mines for the British Columbia Department of Mines. Colliery officials with some of whom Mr. Lancaster has been associated about twelve years, arranged for the presentation as an evidence of their esteem.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.**Kirkland Lake Gold.**

Operations at the Kirkland Lake Gold mine at Kirkland Lake have been curtailed for the time being and a greater portion of the working force have found employment at other mines in the camp. The outcome of the Temiskaming Mining Company's meeting, to be held on the 22nd day of January, will have an important bearing on the future operations of this mine. Should the Culver interests control the meeting, the proposal to take a one-half interest in the Kirkland Lake Gold might receive favorable consideration, and it is anticipated that an immediate resumption of work would result. Other rumors are to the effect that the curtailment of operations will continue for the duration of the war.

Elliott-Kirkland.

The additions to the mining plant of the Elliott-Kirkland have been completed and the work of sinking to deeper levels was recently commenced. The shaft, which previously had attained a depth of 300 ft., will be continued to the 500 ft. level and lateral work will be done at this depth. The westward continuation of the main vein of the Kirkland Lake Gold was encountered in a cross-cut at the 300 ft. level and determined to be approximately eleven feet in width and contained average values of around twelve dollars to the ton. The Elliott-Kirkland represents an honest mining endeavor which has every appearance of being crowned with ultimate success.

Machinery Installed at Wright-Hargreaves.

The installation of the new machinery at the Wright-Hargreaves mine at Kirkland Lake has been completed. A 200 h.p. motor together with a 12-drill compressor now ready for use, will serve to drive operations at greater speed than heretofore. The No. 2 main shaft of the Wright-Hargreaves has reached a depth of 300 ft., and the No. 3 shaft, some 850 ft. west, has been driven to a depth of over 100 ft., and will be continued to a depth of 300 ft., at which depth it is proposed to connect these two workings. After this work is completed a crosscut will be driven to tap the No. 1 vein, which in the early days of the Kirkland Lake camp was opened up on the surface and found to contain excellent gold values.

Canadian-Kirkland.

Along the south and newer zone, of the Kirkland Lake camp, is to be found the Canadian-Kirkland, the Hunton-Kirkland and the Ontario-Kirkland. Active development is being vigorously prosecuted on the Canadian-Kirkland and the property is standing up well under the test. Between this property and the Kirkland Lake Gold, lies the Honer property, on which the Temiskaming Mining Company are commencing operations, and this portion of the camp is receiving merited attention. A pleasing feature of operations throughout the Kirkland Lake camp has been the absence of stock jobbing except apparently in one or two instances. Considering the substantial production of the camp the reputation it now enjoys is indeed very enviable.

Kirkland-Porphyry.

The cross-cut at the 170 ft. level of the Kirkland-Porphyry mine at Kirkland Lake has been driven about forty feet south from the shaft and is said to

be in ore all the way. The orebody is cut with the mud-seam, which is characteristic of practically every mine in the Kirkland Lake camp, the only difference being that two such seams intersect the orebody of the Kirkland-Porphyry. These two mud-seams are about eleven feet apart at the 170 ft. level and the ore between them is said to run high even for the rich deposits of the Kirkland Lake camp. The remainder of the vein carried very substantial average values, and the latter grade of ore is still in evidence in the crosscut. The shaft is being continued to the 300 ft. level. So far the developments at this property have proven even more successful than the most optimistic had expected.

Coniagas.

At the annual meeting of the Coniagas Mines, Limited, held at St. Catharines, it was announced that half a million dollars has been paid in dividends during the past year, making a total distribution of dividends by the company to shareholders to date of \$8,740,000. The price of the product of the company was considerably higher than in former years which worked to the monetary advantage of the company. During the year about \$150,000 has been spent in prospecting work. So far President Leonard said, they have been unable to discover another silver property worthy of development. Much is expected however, from the Ankerite property in South Porcupine, known to be carrying gold values. In speaking of the development of the Coniagas mine, Mr. Leonard said the output of silver this year was 1,344,267 ounces as compared with about one and three-quarter millions the previous year. The total shipments of silver from the mine to date were over twenty-five and a quarter million ounces. The silver ore this year was mined and concentrated at a net cost of 21.36 cents per ounce. R. W. Leonard, St. Catharines, was again elected president.

McKinley-Darragh.

It is understood the method of regrounding the tailings for treatment in the new oil flotation plant at the McKinley-Darragh has not been found altogether satisfactory and a number of alterations will be made during the present cold weather. These alterations will not cause any additional delay, owing to the fact that it has been found more economical to wait until the present cold weather moderates. With the arrival of warm weather in the spring the new plant will be operated at full capacity. During the past year the McKinley-Darragh has yielded in the neighborhood of one million ounces of silver, which placed it in sixth place as a producer in the Cobalt camp. Underground operations at the mine are said to be of an exceedingly favorable nature, and a considerable quantity of the ore now being hoisted, is comparatively high grade. The annual statement of the company is expected to be of a very favorable nature.

Adanac.

During the month of December development work at the Adanac was pushed forward with excellent results. A little over 100 ft. of underground work was accomplished, the vein in the drift maintaining a uniform width. A small amount of high-grade ore is being encountered from time to time and gradually the drift is being continued north to the zone in which geologists have recommended the carrying on of development work. It would not be surprising if the next few weeks work was attended with important developments at this property.

Ore Shipments in December.

During the month of December eleven Cobalt mines shipped an aggregate of thirty-one carloads of ore, containing 2,377,708 pounds. The following is a summary of these shipments:

Mine.	Cars.	Pounds.
Dominion Reduction	8	655,000
McKinley-Darragh.	4	338,204
Coniagas	4	330,295
Buffalo	4	329,958
Nipissing	3	175,077
La Rose	2	167,317
Kerr Lake	2	120,396
Aladdin	1	87,000
National	1	67,179
Penn-Canadian	1	65,761
Trethewey	1	41,521

19,600,000 Ounces Silver in 1917.

The total production of the Cobalt camp for the year 1917 will approximate 19,600,000 ounces of silver. The average price of the white metal for this period has been about 81 1-3 cents per ounce. Thus the value of the output will fall not far short of \$16,000,000. There are approximately 3,000 miners employed in the mines of Cobalt and the pay roll for the year is estimated to aggregate about \$4,320,000. The cost of supplies is said to have been about \$3,000,000, thus making a total operating expenditure of \$7,320,000. This would leave a net profit of approximately \$8,680,000. Of this latter amount over \$5,250,000 has been distributed in dividends and the balance employed in an endeavor to secure other mining properties further north. The year has been one of much prosperity, in which the companies and their employees have each shared. With the close of the year the harmony existing between the men and the operators is highly satisfactory. The men are receiving the highest wages in the history of the camp and in return the efficiency of this large working force is quite satisfactory.

Bullion Shipments.

The production of bullion from the Cobalt silver mines continues large and heavier shipments are due to be made at an early date. The high grade mills are working at maximum speed, and more than ever in the history of the camp, the product of the mines is being shipped in the form of bullion. This form of shipping greatly reduces the cost of transportation. The total bullion shipped by the Mining Corporation of Canada alone during the current year amounted to well over four million ounces. The Nipissing is establishing a record second only to that of the Mining Corporation. The enormous output of these two huge silver mines is a big factor in the world's silver production.

Kerr Lake.

Kerr Lake holds third place in the production of silver in Canada during the past year, being exceeded only by the Mining Corporation of Canada and the Nipissing Mining Company. The November yield amounted to 205,552 ounces, which is at the annual rate of 2,466,264 ounces. The dividend payments for the year amounted to \$690,000, which is equivalent to \$1.15 per share, a Red Cross dividend of 15 cents per share having been paid on August 10th. To date the company has distributed dividends amounting to \$12.45 per share, which is close to 250 per cent. on the par value of the stock. The report of the company for the fiscal year recently ended estimated that the positive ore reserves in the mine contain 3,120,400

ounces of silver. This is a net value of \$3.07 per share. At the present rate of production the reserves would be sufficient for about a year and a half's operations. The silver produced during the fiscal year was 2,551,000 ounces or a monthly average of 212,612 ounces. Production costs during this period amounted to 26 3-4 cents per ounce, which is one and a half cents higher than in the previous fiscal year, due to higher costs of material and labor.

The stock holdings of the Kerr Lake Mining Company include 150,000 shares of Wettlaufer-Lorrain, carried on the books at 15 cents per share, and 837,000 shares of Caribou-Cobalt carried on the books at the dated December 28th, of the operation of the Company also developing under an option of lease and bond, a gold property in the Boston Creek area in Northern Ontario, known as the Mondeau claims located in Me-Elroy township, east of the Gold Leaf property. Reports from this property indicate that satisfactory results are being obtained, and this week it was reported that another claim had been added to the company's holdings in this township.

Bailey-Cobalt.

The dismissal of the appeal of Edwin Benson, of Chicago, former president of the Bailey-Cobalt Silver Mines in an endeavor to collect some \$89,000, which he claimed was due him, leads to the belief that an effort will now be made to reopen this old Cobalt property.

Nipissing.

During the month of November the Nipissing Mining company maintained production at the rate of a little over 10,000 ounces per day, and for the third time during the past year, exceeded three hundred thousand ounces for a thirty day period. During the month the company mined ore of an estimated net value of \$305,572 and shipped products from Nipissing and customs ore of an estimated net value of \$331,196. Underground operations for this month continued to be favorable and a number of new crosscuts were started at various places, most of them heading for new areas, several small veins have already been found and they will be drifted upon in the near future. Stopping operations on all veins continued to produce satisfactory results. A new intermediate level was started from the workings on vein 490. There is a favorable area between that vein at the fifth level and vein 98 at the fourth level, which cannot be explored to best advantage from any present level. About 200 ft. more of vein 490 at the sixth level was put in condition to receive stope timbers. Shaft 81, which was developing the Cobalt Lake fault vein was closed during the month. With the exception of a small amount of ore encountered in one of the drifts, results were disappointing. For the eleven months ended November 30th, the Nipissing Mining company produced \$3,018,280 worth of silver. Heretofore the greatest record attained by Nipissing was in 1913 when a net value of \$2,922,714.26 was received. Thus it will be noted that the value of the first eleven months' production of the past year exceeds that of any twelve months in the company's history by \$95,566 and by the end of December it is estimated the production will have reached upwards of \$400,000 more than in any previous year of the company's existence. The company have declared a five per cent. dividend, together with a five per cent. bonus, payable Jan. 21st next, to shareholders on record Dec. 31st. This disbursement calls for the distribution of \$600,000. When it is remembered that during 1917 the Nipissing has paid 30

per cent. in dividends, amounting to \$1,800,000, and with the distribution of the January bonus and dividend will have disbursed to the shareholders a total of \$17,740,000, the magnitude of this precious metal mine may be imagined. With the current price of silver well above the average price paid during the past year it would not be surprising if the present year would prove the most prosperous in the history of the company.

Temiskaming.

The affairs of the Temiskaming mining company are anything but happy these days, and the President Mr. F. L. Culver in a circular letter under date of Dec. 31st, asks for the support of the shareholders to block the efforts of Messrs Hamilton B. Wills and Max Morgenstern to gain control of the company. A special general meeting of the company has been called for the 22nd of the present month, and the result of this important meeting is being awaited with more than usual interest.

Schumacher.

With the increase in its milling facilities the Schumacher mine is gradually working into a position to be classed as among Porcupine's big mines. This property lies adjacent to the Hollinger and McIntyre and would appear to be in line for important developments. The main workings have reached a depth of 600 ft. With 160 acres situated on the south contact of the porphyry intrusion, which has made its two neighbors famous, this property possesses enormous possibilities. Before long the work of driving the main shaft to a depth of 1,000 ft. will be under way, following the lead of the other important mines. The orebodies on this property have shown a remarkable consistency, and in spite of the shortage of labor the management has kept the enlarged mill operating at capacity, and the cost of operating this property is said to compare favorably with that of the best mines in the camp. It is understood that the ore reserves have increased considerably at the Schumacher since the last annual statement was issued, and the mine is now in better condition than ever before in its history.

Porcupine, V. N. T.

At the 600 ft. level of the Porcupine V. N. T. a comparatively large amount of ore is being opened up. The mill is running to capacity and the value of the production is sufficient to pay all operating costs, inclusive of development work, and a net profit is resulting. Preliminary plans have been made for the installation of a new mill, when conditions become more normal, and the operation of the old mill will serve to finance the new installation. The new mill addition appears to be undoubtedly warranted by the results encountered in development.

McIntyre.

The shaft on the Jupiter portion of the McIntyre property will have reached the 1,000 ft. level before the end of the present week. New pumping equipment has been installed and will meet all requirements. The main drift of the McIntyre, which is headed for this point, is already 600 ft. over the Jupiter line. From the McIntyre shaft to the Jupiter shaft is almost one-third of a mile. The big new hoist installed at the Jupiter will permit of carrying operations to a depth of 2,000 ft. The main or No. 5 shaft is also being equipped with a hoist of similar capacity. The work on this property is being centralized in such a way as to allow of ore from the sixth, seventh, eighth and ninth levels to drop through ore passes to the tenth level, where it is passed from chutes directly into the

ore cars, trammed to the foot of the shaft and hoisted to the surface. Net profits at this property are now greater than at any previous time in the history of the mine, owing to the efficiency of operations.

Groch Machine for a Molybdenite Property.

A contract has been received for the installation of a Groch Centrifugal oil flotation plant of 30 tons capacity, on a molybdenite property about twenty miles from the St. Maurice Mines, near Amos, on the Transcontinental Railway. This system for the treatment of ore has proven successful in the treatment of molybdenite, graphite and the recovery of copper from sulphide for which it is eminently suited; but its application has now been extended to practically every known metal and in the recovery of silver it has proven highly successful. One of these machines has also been in operation at the Miller Independence Gold Mines at Boston Creek, where for the first time in Canada flotation had been successfully applied in the extraction of gold. Arrangements have also been made for the installation of a Groch machine at the McIntyre-Porcupine mines where the machine will be used in experimental work. The construction of this machine differs very materially from that of the Minerals Separation company and has been perfected by Messrs. Frank Groch and W. E. Simpson, of Cobalt. The machine is the product of Canadian inventive genius and is being manufactured by Knight Bros. & McKinnon, of Cobalt, under contract.

Fast Shaft Sinking at Ankerite.

Operations at the Ankerite property of the Coniagas Mining company are in full swing since the installation of the powerful mining plant. The contract for the three compartment shaft to a depth of 500 ft. is being executed at a record rate. A depth of about seven feet per day is being maintained in the execution of this work. If this pace is kept up it will require only about six weeks to complete the shaft to the 500 ft. level. Shaft sinking at the rate of 200 ft. per month has been exceeded in very few instances in any part of the world and demonstrates the increasing efficiency with which mining operations are being conducted in Northern Ontario.

Gowganda.

Shipments of high grade silver ore are being made regularly from the Miller Lake-O'Brien mine at Gowganda. According to the official figures of the T. & N. O. railway this company shipped 61,960 pounds of ore during the month of November.

Porcupine Crown.

The main orebody of the Porcupine Crown mine has been encountered in the crosscut at a depth of 1,000 ft. The average grade of the ore has not been ascertained as yet; but the width of the vein and the appearance of the ore is very similar to that on the preceding level where some of the richest ore yet encountered has been found. It is reasonable to suppose that in view of the favorable results being met with the ore reserves at the mine should exceed those of one year ago, which, after deducting practically all the low grade ore, amounted to \$1,050,000. The reason for curtailing production at the mine during the past year was solely the shortage of labor and the high cost of material, the physical condition of the mine being in no way a factor. With the ore reserves conservatively estimated at \$1,050,000 and a net surplus of about \$275,000 on hand the financial and physical condition of the Porcupine Crown may be considered very good. It is estimated that the net profits in sight from treatment of ore reserves will exceed \$500,000, and with the \$275,000 surplus the intrinsic value of

the company's issued capital of \$2,000,000 is upwards of 38 cents per share. It would appear from the present favorable development at the 1,000 ft. level that there are great probabilities of the main orebody continuing to a much greater depth than yet attained.

Nickel from Alexo Mine.

During the month of November the Alexo Mine at Porquins Junction shipped thirteen cars of nickel ore containing 1,066,900 pounds. This is about 160,000 pounds less than shipped during the month of October.

Trethewey.

The Castle property at Gowganda has been taken under option by the Trethewey Mining Company of Cobalt. The Castle is looked upon as one of the most promising properties in the Gowganda silver area as it is situated along the contact zone along which the Miller Lake-O'Brien is encountering its rich ore. The irregular trend of the Miller Lake-O'Brien vein leaves room for uncertainty as to whether it can be picked up on the Castle property. However, there are a number of other veins on the Castle which possess considerable merit. Early last fall a second-hand mining plant was purchased from the McIntyre mines and this plant is now being transported to the property.

Miller Independence

Milling operations at the Miller Independence Mine at Boston Creek have been suspended until the early spring owing to the scarcity of water. The supply of water was being drawn from an abandoned shaft and when this gave out the mill was forced to close down. Underground operations were suspended for the holiday season, but have been resumed again and will be carried forward with renewed energy.

Prospecting in Cane Township.

Work has been commenced on a group of three claims in Cane township, near Kenabeek station, by a company known as the Cane Silver Mines. Considerable exploration work has been done and several promising veins in which fair silver values occur have been opened up. Arrangements have been made to sink a shaft on one of the largest veins, and the work is now under way.

Good Reports from Lightning River.

Latest reports from the Lightning River district are of a highly favorable nature. The work of sampling the main vein of the discovery group is under way and is said to be proving very satisfactory. The trail from Kirkland Lake to the new gold field is in good condition, and further staking in the vicinity of the find is still going on.

Patricia.

The No. 1 shaft at the Patricia property at Boston Creek has reached a depth of 130 ft., according to latest advices received here. The vein is said to be widening out with depth. The gold content of the ore is high, running as much as 24 ounces to the ton. Work at the No. 2 shaft is also progressing satisfactorily having reached a depth of over fifty feet. Here also the mineralization is heavy and shows a tendency to increase with depth. The new mining plant is giving good results, four machines being used and a maximum speed is being kept up. It is stated that enough gold has been put in sight already on this property to pay for the installation of the plant and development work to date. This record has only been equalled by one other quartz mine on the American continent and that mine was the Croesus, in Munro Township.

The shafts on this property are headed for a depth of 200 ft. and should the ore depositions continue to that depth it is the intention of the management to install a small mill at the property this winter.

Murray-Mogridge.

Excellent results are attending the work in the south drift on the 200 ft. level of the Murray-Mogridge at Bourke's Siding. The full width of the drift is in ore, with only one wall showing. A crosscut is being made near the present face to determine the exact width of the vein at this point. The north drift is through the fault and the drills continue in good ore. The face at this point is somewhat shattered owing to severe faulting, but sampling taken about a month ago have satisfactory average values on this level, but values from the last thirty feet of drilling in the south drift have not been announced as yet, but judging by the appearance of the ore the values will average high.

BRITISH COLUMBIA.

Strike at Trail Declared Off.

Finding themselves without the support of the International Union of Mine, Mill and Smelter Workers, duly accredited representatives of which organization had after investigation found that the Trail Trades and Labor Council had no authority under the laws of the American Federation of Labor to call a strike; that the local union had violated the constitution of the organization to which it belonged, and the smelting works of the Consolidated Mining and Smelting Company of Canada at Trail was "fair," the men who had "walked out" declared the strike off and the company was asked to permit them to return to work, which it consented to do. It will be some weeks, however, before all departments of the company's smeltery and refineries will be again operating at similar capacity to that prevailing when the strike was called. The Trail News estimates that the strikers lost approximately \$216,000 in wages by the strike, which it says "was inaugurated to enforce the eight-hour day for some 450 men—machinists, carpenters, plumbers, pipefitters and day laborers. Further, that "the walkout occurred Nov. 15, a vote having been previously taken at which 352 men balloted in favor of the strike and 42 opposed. In other words, about one-fourth of the employees took the trouble to vote."

There was, in addition to the direct loss of wages to the strikers, that of the large number of miners, railway men and others who were deprived of employment during the period of the strike. Reviewing the whole field that was affected by the strike, Northwest Mining Truth expressed the following opinion: "Loss in one way and another has certainly reached a cool \$1,000,000, and, as far as we can see, for no good purpose."

Mining Companies' Dividends.

Dividends paid by companies operating metalliferous mines in British Columbia are stated to have exceeded \$3,000,000 for the calendar year 1917. Published details are as follows:

Consolidated M. & S. Co.....	\$ 996,503
Granby Consolidated Co.....	1,499,848
Hedley Gold Mining Co.....	240,000
Le Roy No. 2, Ltd.....	29,199
Rambler-Cariboo Mines, Ltd.....	35,000
Standard Silver-Lead Mining Co...	300,000
Utica Mining Co.....	64,000

Total for 1917\$3,164,550

The total for 1916 is shown to have been \$2,891,583, so that there seems to have been an increase for 1917 over 1916 of \$272,967. In the last-mentioned year, however, the Crow's Nest Pass Coal Co. paid dividends stated to have totalled \$372,756, but, so far as known, did not make any profit distribution in 1917, in which case the total of declared dividends from all mining companies operating in the province was nearly \$100,000 higher in 1916 than in 1917.

Copper and Coal Production.

It is reported that there has been a substantial increase in the quantity of copper produced by the Britannia Mining and Smelting Company in 1917, as compared with its production in 1916. If this be so it may make the total quantity of copper produced in British Columbia greater than in 1916, and add this metal to the two or three other metals estimated to have also made an increase. It will have to be a considerable amount, however, to offset the estimated increase in some other metals, notably lode-gold.

The quantity of coal produced in 1917 will probably be found to have been somewhat less than that in 1916. For eleven months ended November 30 the total production reported was 2,196,898 long tons gross, that is, including the coal made into coke. This total is 288,682 tons short of the quantity produced in 1916, an amount thought to be larger than the production for December will be found to have been. However, the decrease for the year is not likely to be more than 30,000 or 40,000 tons.

The French Zinc Recovery Process.

At a public meeting held in Nelson, West Kootenay, on December 19, under the auspices of the Nelson Board of Trade, a committee was appointed to draft a resolution to be forwarded to the Provincial Government, from which further financial aid is being sought with the object of getting into operation the zinc works at Nelson, designed to recover zinc by the French electrolytic process, the rights to which are held by the French Complex Ore Reduction Company. The Provincial Government has already guaranteed the company's bonds to the amount of \$40,000, which amount is understood to have been expended in altering and adding to the plant at the zinc works near Nelson, at which there has been in past years considerable experimentation in connection with the electric smelting of zinc-lead ores. The resolution since drafted urges the Provincial Government "if possible, to either secure entire control at the earliest possible date of the process, patents and all other property of that company, or to take steps to complete the necessary financing of that company in order to bring its plant at Fairview, near Nelson, to successful production." It was stated that the meeting believes that at the plant successful production was on the point of being attained. It was suggested that about \$25,000 is required to place the enterprise in the position of being a going concern.

Mining and Smelting on Vancouver Island.

The proportion of the total production of coal in the province during eleven months to the end of November, 1917, credited to Vancouver Island collieries is 71 per cent., which indicates that there has been much more activity at the Island mines during the year than at those of the Crow's Nest district. The Canadian Collieries (Dunsmuir) Limited comes first, with an output of approximately 740,000 long tons—471,000 from its mines in the Comox district and 269,000 tons from those at Extension. The Western Fuel Company's total for the eleven months was about 597,000 tons, and

that of the Pacific Coast Coal Mines nearly 141,000 tons. Other mines together produced about 85,000 tons.

Metalliferous mining is not yet resulting in the production of any considerable quantity of ore. The Ladysmith Smelting Corporation, however, is again operating the smelting works at Ladysmith, and is also doing some development work on the Willow Grouse group of copper claims at Sooke, in Victoria mining division. In the same neighborhood, the Margaret group is producing ore and shipping it to Ladysmith. Other Island mines are not shipping to Ladysmith.

INCREASING VARIETY OF PRODUCTS FROM CANADIAN STEEL PLANTS.

In an article written for the Annual Financial Survey of the "Globe," Mr. J. Frater Taylor, President Algoma Steel Corporation, says in part:

"It is intensely difficult to diagnose the general steel situation at the present moment on account of existing conditions.

"The situation in the United States has changed, not so far as intensity of demand is concerned, but on account of the new factors, such as control of output and prices in view of America's entry into the European war. Conditions in the United States have an intense bearing upon the situation in Canada, not only as regards consumers of steel, but upon steel plant operations as well. Everything of the nature of iron or steel and everything entering into the production of iron and steel, must now, of necessity, come under microscopic investigation, so that the proper uses of all materials vital for war purposes may be established. The inevitable consequence is that export licenses, priority certificates and so forth, are necessary, both in respect of internal consumption and of exports to Canada. It is indeed difficult to say what the precise effect will be upon the Canadian steel industry and upon the consumption of steel products in Canada, but unless one is well provided, delays would appear to be the least of the prospective evils to be faced, and the worst of these evils is the possible curtailment and stoppage of certain supplies altogether.

"To some extent—indeed to a considerable extent—Canada can become and should become self-supporting. At the Algoma Steel Plant many materials and articles hitherto imported are now manufactured and there is every probability that 'self help' will be still further developed, but there are propositions which no ordinary Canadian steel company would care to face, such as the installation and development of the great basic plants necessary for the production of certain classes of steel."

MURRAY MINE.

Good results are being obtained in developing the nickel-copper orebody at the Murray mine of British America Nickel Co. The underground work is disclosing ore, as indicated by the diamond drills.

WAREHOUSE AT MURRAY MINE BURNED.

Fire broke out at 7 a.m. in the warehouse of the British America Nickel Co. at Murray mine on Jan. 2. The warehouse, which was well stocked with supplies, was a total loss. The building was an old office building, which had been remodeled for use as a warehouse and construction office. While a considerable quantity of supplies was destroyed, no serious delay in construction is expected to result. The fire was caused by trouble with the heating apparatus.

HISTORY OF DEVELOPMENT OF PETROLEUM INDUSTRY

At a meeting of the Toronto section of the Society of Chemical Industry, to be held at the Engineer's Club on Friday evening Jan. 18, Mr. Schorman, technical expert of the British American Oil Co., will present a paper on the history of development of the petroleum industry. Those who are interested in this subject and wish to attend the meeting may obtain further particulars from the Secretary, Mr. Alfred Burton, 114 Bedford Road, Toronto.

MINE HOISTS and BUCKETS

One Mining Company is now operating seven of our Mine Hoists. Need we say any more as to their reliability.

We supply them either with boiler, as shown, or without boiler, but with engines for steam drive. We also make them for electric drive, or for gasoline drive, as desired.

We make these Mine Hoists in 7 sizes, from the little 10 H. P. size for prospecting or for small mines, to the heavy duty 50 H. P. machines.

Any size made with one, two, three or more drums.

Oxy-Acetylene Welding and Cutting

Better Work at Less Cost

In thousands of Machine shops, Mines, Railroad Shops and Factories, both in Canada and the States, the adoption of this process has made possible many important improvements and economies. Leading manufacturers are increasing their output, and making stronger, neater products, at less cost.

On repair work alone, one Prest-O-Lite welding operation frequently pays for the outfit by avoiding a replacement or preventing a tie-up.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Latest Model
No. 6 Wilfley Table

Large capacity—Clean separation—

The WILFLEY TABLE was the pioneer concentrating table and its margin of superiority over other types of concentrating machines in capacity and low cost of operation and maintenance is to-day greater than ever before.

The Wilfley engineers are backed by 20 years of experience in this field, and from this experience has been developed the Wilfley of to-day. There are several new types of Wilfleys, each designed to meet special conditions. The WILFLEY TABLE is of great simplicity in design, yet has large capacity, and will make a clean separation. Our No. 1623 and No. 10 riffing systems have been developed to give great capacity, and clean separation in complex ores.

All Wilfleys are equipped with latest improvements, such as adjustable wash-water and feed-box, new draw-bar, improved tilting device, etc.

Write us fully concerning conditions in your mill and our engineers will recommend the type of WILFLEY best suited to your requirements.

Manufactured in Canada by Wabi Iron Works,

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to **The Director, Mines Branch, Department of Mines, Ottawa.**

Applicants for publications not listed above should mention the precise area concerning which information is desired.

Maps published within recent years may be had, printed on linen, at the nominal cost of ten cents each.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to **The Director, Geological Survey, Ottawa.**

To Users of the Callow Pneumatic Flotation Cell

USERS of the Callow Cell are naturally interested in knowing how the decision of the United States Circuit Court of Appeals for the Third District, in the Miami case, will affect their interests.

As we understand the prevailing opinion of Judge Woolley in the Miami case he has interpreted the Supreme Court decision in the Hyde case as meaning that "*invention resides not alone in the critical proportion of oil, but also in air and agitation,*" and again, "*in the co-action of the critical proportion of oil and air effected by 'an agitation greater than, and different from that which had been resorted to before,' resulting in a froth concentrate of economical value,*" and further, that the Supreme Court did not limit the patent to "*agitation by mechanical means,*" but to agitation of a violent and persistent kind; "*it mixes the oil with the metal of the ore. This is old. Then, by its greater intensity and longer duration, it stirs the pulp into a froth.*"

Thus, this decision of the Third Circuit Court of Appeals has a most important bearing upon the art, because it holds that the mixing of the oil with the mineral is old, but it **leaves open the use of oil in connection with aeration-cells.** Meanwhile the idea of a "*critical*" proportion of oil has been dis-

proved by practice in several mills within a short time after it was promulgated.

Judge Woolley says further, concerning the Callow Cell: "*Aeration is direct, and is not the result of or caused by agitation. On the contrary, agitation results from aeration and such agitation, though present in some measure, is not even approximately of the violence and duration of the agitation of the patent. The operation in the Callow Cell certainly possesses these distinguishing features from operation of the process where aeration is caused by agitation.*"

The Court further confirms this important dictum by saying: "*If the only agitation to which the pulp was subjected (after such agitation as in the prior art was necessary to mix the oil and ore) was the agitation of the Callow Cells, we would not say that that agitation amounted to or was the equivalent of the violent agitation of the patent disclosure and constituted infringement.*"

Apparently users of the Callow Cell may feel assured they do not infringe the method of agitation described in U.S. Patent No. 835,120 (less than 1% oil), No. 962,678 (soluble frothing agents), No. 1,099,699 (phenol or cresol in the cold without acid) since all three of the patents are of the same processs, dependent upon a certain degree of violence and length of agitation and the production of the same characteristic froth, as set forth in their claims.

(Signed) J. M. Callow.

10 Convincing Facts About NEW CLEVELAND TYPE S POCKET-IN-HEAD STOPPERS

1. Faster drilling.
2. Lower repair cost.
3. Drop forged parts throughout.
4. One diameter reversible piston.
5. Unbreakable valve and valve block.
6. Larger air ports than in any other stopper.
7. Greater valve surface, hence longer life.
8. Pocket-in-head reservoir.
9. Lower air consumption because of pocket-in-head.
10. SATISFACTION.

They explain some of the reasons why "New Cleveland" Pocket-in-head Stoppers are successful.

Building Bigger Business by Better Methods

All industries using iron and steel in quantities will find C.G.E. Art Welders economical, speedy and safe for cutting, joining or building up work.

Ship Yards—Repairs to Steel plates.

Blast Furnaces—To clear out frozen tap holes.

Steel Foundries—To cut off risers, to reclaim defective castings, to cut scrap for cupolas.

Rolling Mills—To save worn out machinery and parts such as shafts, frames, spindles, ladles, rolls with wobblers.

Railroads—Repair work from the rims of the wheels to the roof of the cab, fireboxes, seams, piston rods, smoke stacks, fractures to frame work, repairs to steel cars, etc.

General Manufacturing—For construction as well as repair work in automobile plants, locomotive shops, boiler and tank works and general manufacturing.

For Drilling Upper Holes

There's a Sullivan Stoper

exactly suited to your needs. If your ground is soft or broken, choose "D F 21" **Light-hitting** Stopers. If your ground is hard and tight, choose "D G 21" **Heavy-hitting** Stopers. Then there's the "DA21" for average conditions, and the "DC21," with air jet, for flat holes. An atomizer, for laying dust, may be attached to any of these drills.

Sullivan Stopers of all types are profit-earners. Their great cutting speed, low air consumption and splendid stability render them favorites in many of the world's mining districts.

They're Fast
They Last

A New "Little David" Grinder

For Squaring Off Rock Drill Shanks,
Dressing Rock Drill Bits and Reaming
the Hole in Shanks of Hollow Drill Steel.

*Saves Piston Breakages
Keeps up Cutting Speed*

*"Little David" Pedestal
Grinder No. 8.*

The "Little David" Pedestal Grinder will help you to get and maintain the greatest practicable freedom from drill stoppages due to broken drill shanks and pistons, as well as to get the best action when using water and hollow steels.

This grinder may also be used for general grinding purposes

This is a new tool for mine use which adds greatly to the efficiency of drill sharpening equipment. While the drill sharpener insures a plentiful supply of sharpened steel, properly formed shanks have much to do with the final results in footage.

Let us send you Bulletin 4041 which tells the whole story. Other bulletins are yours for the asking also.

SPEEDING UP!

A MOST VALUABLE LESSON THIS WAR HAS TAUGHT

SPEED, EFFICIENCY, ECONOMY

The war has given us an overwhelming example of the importance of these three great lessons. Speed is most essential, but no speed that has staying power is attained without efficiency. Economy is also needed, but it is economy of time, materials and labor, not merely economy in first cost that counts.

By using the "New Cleveland" Stoper, you will attain speed equal to double that of any other drill on the market. Its staying power is equalled by none. Its drop forged parts of simple design, which are practically unbreakable, give you economy in time and repairs; also the air consumption is low because of the "Pocket-in-head."

Give us an opportunity of proving these facts to you. No obligation on your part.

FLOAT FEED

CARBIDE MINE LAMPS WORK WITHOUT WATCHING

When the flame of a hand regulated lamp gets small the miner either works the raking wire—turns on more water or bumps the lamp against a rock. The first method generates too much gas, the second floods the carbide and the last damages the lamp. The flame of an ITP remains the same size from start to finish of the charge and the proof that the ITP never needs regulating is the simple fact that there is nothing on this lamp which can be regulated.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167 603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

FRESH MILK *for* MINERS

Klim is pasteurized separated milk in powder form. It bulks small and weighs 50% less than any other form of milk. It is pure. Contains no preservatives or adulterants. Klim will not freeze nor turn sour. It will remain fresh indefinitely. Mix dry with other dry ingredients in cooking or dissolve in water for use as liquid. A pound makes four quarts which cannot be distinguished in taste from fresh liquid milk. Use Klim in camp or on prospecting trips.

Flood Lighting with the Garrow Light

This method of lighting has been considered by engineers to be the most efficient. Today it is being adopted more and more widely by Railroads, Engineers, Contractors, and for public buildings.

The Mining Engineer will secure the most effective Flood Lighting by the use of the Garrow Light. It is self-contained. Can be placed anywhere. Has a powerful 3,000 C.P. burner, and is inexpensive.

Manitoba can easily be supplied with high grade Canadian coal, if a reasonable freight rate can be secured by coal operators. Proper utilization of Canadian coal in Manitoba has been made impossible by the railway companies. A fair freight rate for Canadian coal should be insisted upon.

There are many undeveloped coal deposits in the United States which might be developed by Canadians for consumption in Central Canada. Capital might be found in Canada for opening coal mines to supply the Canadian market if some assurance were given that the producers would be permitted to ship their product to Canada.

THE COAL SHORTAGE.

The public is now beginning to realize that an adequate supply of coal is a fundamental necessity in carrying on war. Early in 1915 the folly of neglecting to provide for the working of collieries to capacity was recognized in England and a Parliamentary Committee was appointed to enquire into the effect of recruiting mine workers. It was soon found that miners had responded in such large numbers to the call for volunteers that coal production was diminishing at an alarming rate. The committee advised that coal miners should not be taken from the mines.

Canadian coal producers early recognized the folly of recruiting miners; but for some time, doubtless because they believed it their patriotic duty, they refrained from calling attention to the result of encouraging these willing men to enlist. Two years ago, however, they decided it was their duty to state their views and they called the attention of the public and the Government to the seriousness of the situation and predicted the coal shortage which is now brought home to everyone. Prompt action might have greatly improved conditions. The disinclination to do anything to discourage recruiting, however, made the task a difficult one and there was great delay long after the facts were known. The damage has been done and yet we must now find means to produce and transport fuel in larger quantities than ever before.

There is plenty of coal of good quality in Canada and the United States. We may find it advisable to use peat and lignite in some localities; but the chief problem is the mining and transportation of the excellent coal which North America is fortunately endowed with. Shortage of miners and coal-carrying ships in Nova Scotia makes us more than ever dependent on the United States. Our American friends appear to be able to produce plenty of coal; but they are unable to get cars.

It would obviously be to the advantage of Ontario, which produces no coal, to find a substitute fuel. We have peat bogs which might be developed to advantage and there are indications that something will be done along this line. The simplest way to cut down our coal imports in Ontario is, however, to utilize our water powers. When the public ceases to be satisfied with raving about the beauty of Niagara Falls and is ready to utilize fully this source of power, situated so fortunately close to Ontario's great industrial centre, we can do without half the coal we are now importing. When Niagara Falls and the St. Lawrence are doing the work which they should do, and our railroads are electrified, there will be little need of coal for power purposes in Ontario.

An interesting pamphlet on "Carbonizing and Briquetting of Lignites" has been published by the Commission of Conservation, Ottawa. The report was prepared by Mr. W. J. Dick and contains data on the probable cost of carbon briquettes in Manitoba and

Saskatchewan, as estimated by R. A. Ross of the Honorary Advisory Council for Scientific Research. Mr. Ross estimated the cost at \$7 per ton on a basis of \$1 per ton for coal used. Mr. Dick estimates that the cost at Bienfait would be \$7.25 per ton of carbonized briquettes produced. Mr. Dick, allowing for a profit of \$1 per ton, estimates the price at various towns in Manitoba and Saskatchewan would be \$9.75 to \$10.15 per ton f.o.b. cars, which he points out is somewhat less than the price of U. S. anthracite in these towns.

A strange and regrettable feature of the report is the impression given that the district is dependent on the United States for its supply of high grade coal. Our enormous supply of excellent bituminous coal in the West is completely ignored in the report and the casual reader may imagine that the district is absolutely dependent on the United States for good coal. Mr. Dick says: "It is inconceivable what would happen if the exportation of hard and soft coal from the United States were prohibited." Considering that he is referring to a district that could readily be supplied with first class Canadian coal we cannot understand the purpose of such a statement.

The decision of the Mines Department to discontinue the concentration of molybdenite ores has created some consternation among those who are planning to work molybdenite deposits during the coming summer. It should be borne in mind, however, that the undertaking of custom work by the Mines Department was never intended to mean that the laboratories should be permanently used for such purposes. Mr. Mackenzie and his assistants investigated processes of treatment of molybdenite ores and then undertook to do custom work until producers should instal their own plant. For various reasons this custom work has been carried on longer than was expected and the Mines Department has thus been deprived for some time of the services of men and the use of laboratories needed for investigations. Unfortunately, those who have become interested in molybdenite production have assumed that custom work would be continued by the Mines Department. This being the case, some time will be needed to make necessary arrangements for concentration of ores from properties that will be opened up as soon as the snow has disappeared. Those who propose to begin development work this spring will not have much time to test their deposits before the only custom concentrator is closed.

According to cable messages from London, the British Government is making changes that should materially increase the efficiency of its Intelligence Departments. A new department will absorb several subdivisions of the Board of Trade and the Foreign Office. The status of Trade Commissioners is to be improved and the best men are to be obtained "from any source." Recent announcements indicate that more attention is to be given to Canada. Mr. Hamilton Wickes, senior British Trade Commissioner in Canada is to go to London and is to be succeeded by Mr. G. T. Milne. Mr. F. W. Field of Toronto, editor of the "Monetary Times" is to be appointed British Trade Commissioner in Toronto.

Mr. Field is an Englishman who has been in Canada for the past twelve years. He has earned a reputation as a leading authority on financial affairs in Canada and will be able to keep London well informed of conditions here.

CIVIL ENGINEERS CHANGE NAME OF THEIR SOCIETY.

It is difficult to see what advantage will accrue to the Canadian Society of Civil Engineers in the changing of its name to that of the Engineering Institute of Canada. The society has long borne a name similar to that of a society of high standing in Great Britain and to that of one in the United States. It would appear that such a well established name would carry more weight, not only in Canada but abroad, than would any new title. Abroad the new name will tend to be confused with that of such societies as the Amalgamated Engineers, who now are in the spot light in Great Britain and consist of stationary engineers and other mechanics.

The new name is not definite enough. Unlike that of the mechanical engineers, chemical engineers, et al, it does not indicate whether its membership represents a profession, a trade, or whether it is an organization for merely educational work, such as collegiate institute, Fraser institute, etc.

Heretofore, the Canadian Society of Civil Engineers has admitted as members only those men who were possessed of well proved professional qualifications. It has been strictly a society of professional men, and has not represented an industry as well as a profession, as does, for instance, the Canadian Mining Institute.

A few years ago it was proposed to change the name of the American Institute of Mining Engineers to one that would indicate that the membership embraced metallurgists, but the members would not agree to the change, preferring the name that during a period of forty years had come to be recognized with respect throughout the world.

The C.E.'s, in changing their name, appear to be working against the tendency of the age. Specialized effort during the last few decades has resulted in the formation of a number of engineering societies that have no official connection one with another. In the United States there are, for instance, in addition to that of the civil engineers, those of mining engineers, mechanical engineers, electrical engineers, and others. Some of these societies are composed entirely of professional men, while the membership of others represents both the profession and an industry. As time goes on there will not be fewer engineering societies, but more of them. Even at present in Great Britain there are two distinct societies, both under royal charter, whose members are associated with the mining industry. One of these societies, whose membership is entirely professional, deals with the whole industry with the exception of that of coal, while the activities of the other are chiefly concerned with this substance. In the United States one mining society is composed entirely of professional men, while the other great institute in its membership represents both the profession and the industry.

During the past twenty-five years the Canadian Society of Civil Engineers has attempted, at various times, to have laws passed in the provincial legislature making engineering a closed profession, like that of law or medicine. In this they were badly advised, as no legislature after due consideration would agree to such a backward and undemocratic step. Doubtless wiser councils will prevail in the renamed society and members who are inclined to grasp at the unattainable will be restrained.

While one cannot but regret the passing of the historic name of the society, like that of some great personality, let us hope for the prosperity of the newly christened organization.

So far as we know the decision of the Canadian Society of Civil Engineers to change its name is not because its officers are ashamed of the misleading propaganda which they have been responsible for during the past year. The society has not yet made amends for the false statements concerning the Canadian Mining Institute contained in a pamphlet which it published.

Canada has plenty of coal in East and West, both for ourselves and the Atlantic and Pacific States. Central Canada has no coal; but is conveniently supplied by coal-fields of the United States. We import far more than we export; but we can export far more if the United States wants it and if miners and ships for coast trade can be obtained.

COPPER PRICE FIXED AT 23½c.

Washington, Jan. 22.—President Wilson to-day approved the recommendation of the War Industries Board that the maximum price for copper fixed upon its recommendation by the President, and announced September 21, 1917, be continued in effect upon the same conditions until June 1, 1918. The maximum price under this action will be twenty-three and one-half cents per pound, f.o.b. New York, subject to revision after June 1, 1918, upon these conditions:—

That the producers will not reduce the wages now being paid.

That the producers will sell to the allies and to the public copper at the same price paid by the Government, and take the necessary measures under the direction of the War Industries Board for the distribution of the copper to prevent it from falling into the hands of speculators who would increase the price to the public.

That the producers pledge themselves to exert every effort necessary to keep up the production of copper to the maximum of the past, so long as the war lasts.

F. W. FIELD

British Trade Commissioner at Toronto

Mines Department Will Discontinue Custom Work

Mr. Geo. C. Mackenzie, Chief of the Division of Ore Dressing and Metallurgy, Department of Mines, Ottawa, in a letter dated January 16th, says: Subsequent to the decision of the Canadian Government that exports of molybdenite and tungsten will be licensed for shipment to France and the United States, the Testing Laboratories of the Department of Mines have been requested to undertake the custom milling of molybdenite ores for various private interests.

In view of the fact that the normal functions of the Testing Laboratories are interfered with to a considerable extent with such custom work, I have been instructed to inform you that shipments of molybdenite ores will be received for treatment **only until 31st July next**, in order that operators may have an opportunity of taking advantage of the market in the United States and France while undertaking the construction of their own concentrating mills.

Shipments of crude ore received for custom work will not be allowed to interfere with the routine work of the Laboratories and will only be accepted on the advice of the officer in charge of this Division.

The charges set forth in the attached schedule include unloading when ore is delivered on the railway siding at the testing plant and concentrating and assaying, but do not include charges incidental to packing and shipment of concentrates.

Concentrates and ores will be accepted at owner's risk and the Department does not hold itself responsible for loss through fire or accident beyond our control.

Concentrates will be delivered at Ottawa or shipped at owner's direction and expense on the receipt of a certified cheque covering all expenses due the Department in connection therewith.

Schedule of Prices.

Governing the milling of molybdenite ores and concentrates delivered F.O.B. Dominion Government Testing Plant, Ottawa.

Concentrates will be made upon the following terms:

- (1) On assay returns from samples dried at 212 deg.
- (2) Moisture will be deducted.
- (3) The treatment charge to be \$5.65 per ton of 2,000 lb. of crude ore.
- (4) Credit will be given for molybdenite only. No allowance will be made for molybdite or wulfenite.
- (5) Recoveries of molybdenite per ton of 2,000 lb. dry ore delivered railway siding, Mines Branch Testing Laboratories, Ottawa:—

For molybdenite ores containing—

- (a) Between 0.5 per cent. and 1 per cent. inc. for 70 per cent. of the total molybdenite content.
- (b) Between 1.1 per cent. and 1.5 per cent. inc. for 78 per cent. of the total molybdenite content.
- (c) Between 1.51 per cent. and 2.0 per cent. inc. for 84 per cent. of the total molybdenite content.
- (d) Between 2.1 per cent. and 2.5 per cent. inc. for 87 per cent. of the total molybdenite content.
- (e) Between 2.51 per cent. and 3.0 per cent. inc. for 90 per cent. of the total molybdenite content.
- (f) Between 3 per cent. and .. inc. for 92 per cent. of the total molybdenite content.

Many Lives Lost at Allan Shaft

Stellarton, N.S., Jan. 24.—No sign of life was heard to-day in the Allan shaft of the Acadia Coal Company's mine, where an explosion occurred last evening. The rescue workers managed to reach the upper levels, and there found fifteen bodies. The number of miners unaccounted for is 81, for whose safety little hope is entertained. Many of them are a thousand feet under the ground, and cut off from help from the outside by huge falls of coal.

The cause of the explosion is unofficially given as an accumulation of gas. One of the Government's inspectors entered the shaft this afternoon to begin an investigation of the disaster.

In the meantime every preparation has been made to look after any injured that may be rescued.

With the arrival of the special train from Cape Breton to-day with 32 experienced Draeger men and apparatus, more effective rescue work can now be done at the Allan shaft.

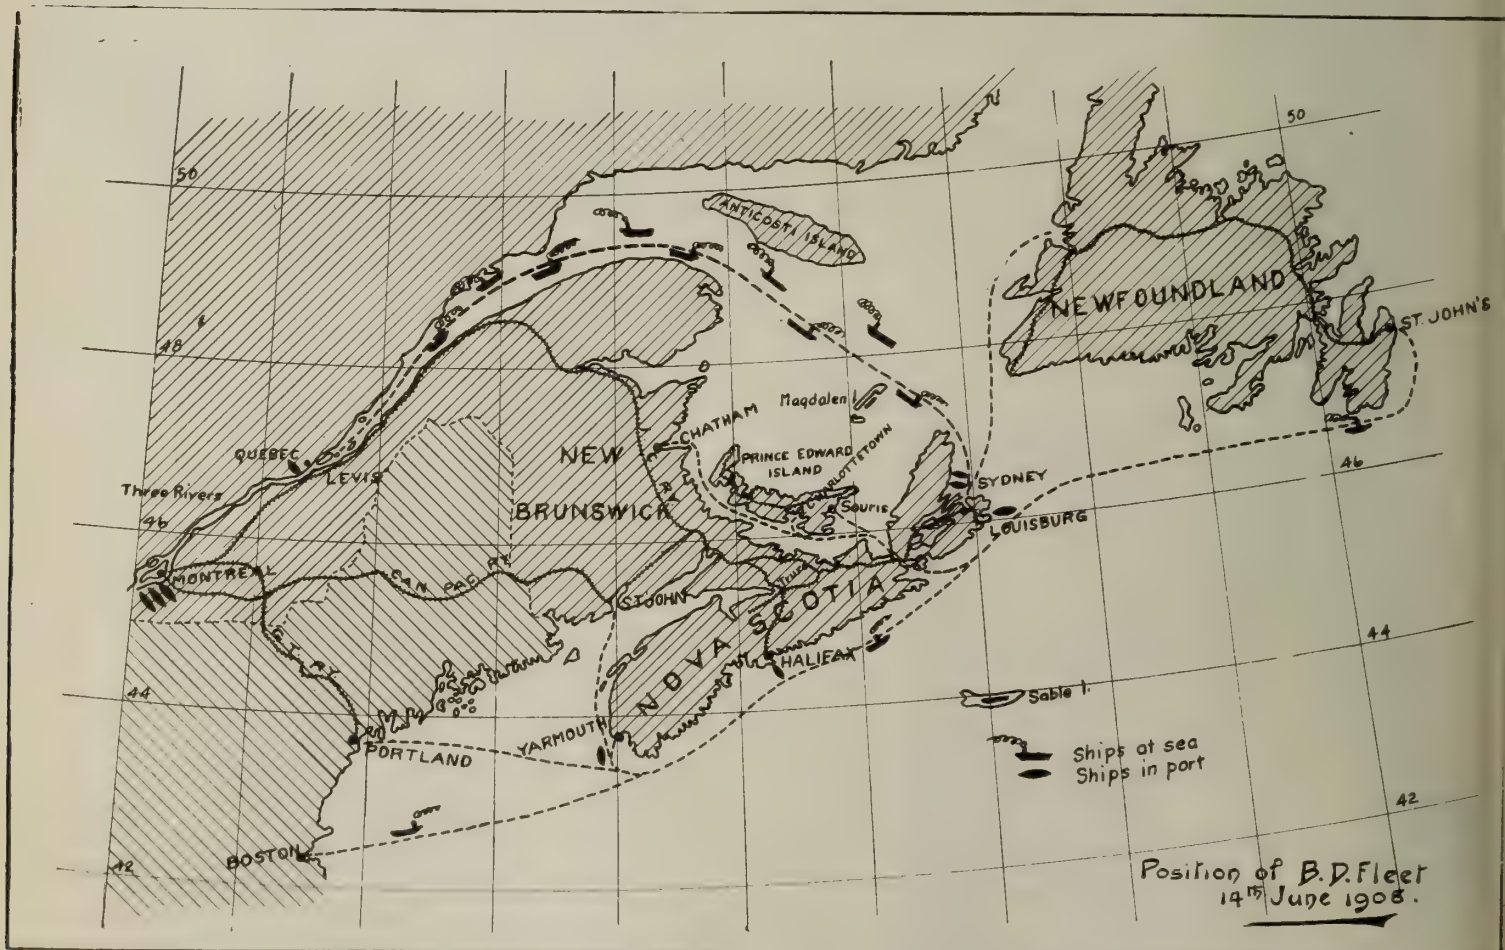

The rescue workers have been particularly warned to look out for fire, as it is suspected that behind the falls of coal may be raging furnaces.

Halifax, N.S., Jan. 24.—The death toll of the disaster at the Allan shaft, Acadia Coal Company's collieries, Stellarton, is now listed at 98. Company officials say that there were one hundred and five men in the mine at the time. Seven of these, on the first landing, escaped, and seventeen bodies have since been recovered, the last two having been brought out late this afternoon. Twelve of the bodies have been identified as miners belonging to Stellarton and Westville, three are Frenchmen, and the other two are unrecognizable.

There is now no gas in the mine, and the work of clearing away the debris is proceeding apace. A few small falls at the bottom of the shaft have been cut through, but there appear to be heavy falls ahead, and officials are unable to say when they will be able to reach the eighty-one men still in the mine. They have given up all hope of any of these men being alive, maintaining that all who were not crushed to death by the debris must have died of suffocation many hours ago.

The explosion at the Allan shaft has cut down the Pictou county coal output by 500 tons daily, and there is now some fear of a coal shortage there. The entire plant of the Nova Scotia Steel & Coal Co. has been closed down until Tuesday next.

An inquest into the disaster will be held to-morrow afternoon by Coroner Kennedy of Stellarton, and it is understood will adjourn until next week, when it will develop into a formal investigation.

SKETCH MAP SHOWING LOCATION OF THE COAL AND IRON INDUSTRY OF EASTERN CANADA

Newfoundland produces iron ore. Nova Scotia produces coal. The steel works are at Sydney and New Glasgow, Nova Scotia

VANCOUVER MAY HAVE STEEL PLANT.

Vancouver, Jan. 22.—The Province to-day has a despatch from Victoria which says an intimation was given by Hon. Wm. Sloan, Provincial Minister of Mines, that Vancouver might become the headquarters of a large electrical smelting and steel plant industry, and enter the world's competition for steel shipbuilding "on the same basis as Belfast and Glasgow."

"For several months past," the story continues, "it is said, the Government has been engaged in negotiations with Eastern capitalists and electrical smelter experts. The negotiations now have reached a point where the Government has agreed to join with the Pacific Steel Company of Eburne and the Aetna Iron and Steel Company of Port Moody—in which companies the Tudhope interests of Orillia, Ont., and R. F. Turnbull, a well-known electrical metallurgist of Welland, Ont., are identified, together with other interested parties—inviting an eminent outside metallurgist of international standing to visit Vancouver and make a final report on the proposal to establish a steel plant here. It is understood if the final report proves satisfactory the Government will extend the company its aid and influence."

This information, adds The Province, was confirmed by Hon. J. W. deB. Farris, Attorney-General. The Tudhope-Turnbull interests, he said, for some time had been active in sizing up the iron and steel situation on the Pacific coast.

Another short course in mining and associated studies has been commenced at the University of British Columbia, Vancouver, B.C., the instruction to extend over eight weeks. Similar short-course instruction in mining is popular in the Northwestern States, at Colleges of Mines in Washington and Idaho especially.

CHROMITE.

An important chrome deposit, recently discovered, is being developed near Richmond, Quebec, by D. B. Sterrett. Quebec is an important producer of chromite. Nearly all the chromite produced is exported to the United States where there is an excellent demand.

KAOLIN FOR FIREBRICK.

Development of the kaolin deposit at St. Remi d'Amherst, Quebec, has proven the existence of a large body of kaolin suitable for the manufacture of firebrick. The company's operations were begun with the intention of producing kaolin for china and pottery making as part of the deposit is suitable for this purpose. A very large amount of kaolin, not suitable for pottery making is available for fire-brick.

MOLYBDENITE.

The chief producer of molybdenite in Canada at present is the Dominion Molybdenite Company which is operating the Moss mine at Quyon, Quebec. The company has erected at Quyon a concentrating plant to treat 200 tons per day. It is understood that the development work has proven the existence of a large tonnage of low grade ore, averaging about 0.7 per cent. molybdenite.

United States Wants Chromite

According to the U. S. Geological Survey more chromite than is now obtainable is needed in the United States. A recently issued statement is in part as follows:

"The mineral chromite is the source of the metal chromium, which, as an alloy in chrome steel and in several chemical compounds, occupies an important place on the battle front on both land and sea. The compounds furnish the strong and durable yet subdued and protective colors that are used to dye the soldiers' khaki clothes and tan the upper leather of his shoes. Chromite readily forms alloys with iron and gives hardness to the steel that is used for armor plate on war vessels and for the armor-piercing projectiles which they hurl at the enemy. It is one of the essential elements in stellite, which is now so largely employed in making high-speed tools for cutting steel in the manufacture of munitions.

"Unfortunately for the United States the present domestic output of chromite is scarcely one-fourth of the quantity needed for war and domestic uses, so that the other three-fourths must be imported. Hitherto most of our imported chromite has come from Rhodesia and New Caledonia, and, notwithstanding the scarcity of ships, much of it still comes from those distant lands. In response to our call for chromite Canada has rendered us most efficient help. In 1916 she sent us 10,930 long tons and in 1917 she more than doubled her shipments of chromite to the United States. At present we are facing a deficit in the supply of chromite and we should spare no effort to increase the output of this country as well as that of adjacent countries.

"Most of the chromite we use is needed in factories in the eastern United States and on account of the difficulty and expense of long transportation from the western deposits one of our most urgent present needs is to increase the production of chromite in the Atlantic States. The chrome industry of America really began in the Eastern States. The mines of Maryland and Pennsylvania once supplied the world's chromite."

Twenty years ago, in January, 1897, a commencement was made to ship ore from the Le Roi Mine, Rossland, B.C., to the smelting works at Northport, the contract to send 75,000 tons to the smelter established at Trail early in the previous year by the late F. Aug. Heinze, having been completed. From the beginning of production, in 1894, to the end of 1897 the output of the Le Roi mine has totalled about 2,023,000 tons of gold-copper ore having a gross value of approximately \$26,000,000.

The Steel Co. of Canada will build an addition to its plant at Brantford, Ont., involving an expenditure of \$100,000. Extensions to the company's plant at Hamilton, Ont., are also under way, in addition to the coke oven plant which is expected to be completed by next spring. Although the company has large shell contracts on hand, more attention is now being paid to the development of business along ordinary lines, the extensions referred to being part of this policy. The shell plant at Montreal has been closed and the space will be utilized for other purposes. The shell plant at Brantford will be operated to capacity and shrapnel bars will be rolled at Hamilton.

The Electrolytic Process for Recovery of Zinc

In a paper presented at the Pittsburg meeting of the American Electrochemical Society, Oct. 3, Mr. Thomas French, of Nelson, B.C., said in part:

In the last two years a large quantity of high-grade electrolytic zinc has been produced in the United States and Canada, and at the present time many other plants are projected. In view of this rapid progress the question has often been asked: Will the older retort process of smelting be superseded by the electrolytic deposition of zinc?

The reply to this question is generally given in an unqualified negative, apparently justified by the rather unsatisfactory recoveries of zinc obtained by those who have adopted the electrolytic process. The poor recovery is attributed mainly to the difficulty of roasting the ore without the formation of ferrite of zinc, which is very difficult to dissolve in the acid effluent from the electrolytic vats, but also to the difficulty in dealing with the filtration of slimy acid and neutral solutions.

We hear of great variations in the amount of zinc that can be dissolved from the roasted ore. Sometimes a 90 per cent. extraction of the zinc in the ore is obtained, and at other times only half, or even less than that amount, from the same ore. The average recovery of zinc appears to be less than 70 per cent. by most of those engaged in the manufacture of electrolytic zinc from ores or concentrates containing about 40 per cent. zinc.

If an extraction of 90 per cent. of the zinc can at times be obtained, and at other times cannot be obtained from the same ore, then assuredly, sooner or later, the reason for the disparity will be found. That being so, and taking into consideration several weighty factors favoring the electrolytic process for the reduction of zinc from its ores, there is more than a strong probability that the retort process for the reduction of zinc is doomed in the near future.

In forming this opinion, one of the chief considerations is that electrolytic zinc is being produced either by lead or copper manufacturers, and may be considered to be a by-product. It is true that some of these manufacturers are treating customs ores, but this is only to take advantage of the very profitable price of zinc which has ruled for some time, and to fulfil large contracts. The primary reason for the erection of these electrolytic plants was to extract from their own ores the zinc which previously had either been wasted or not worked at all.

In the case of the lead smelter, especially those whose ores contain much zinc, it is imperative that the zinc should be extracted, in order that the lead may be profitably smelted. Before long a modern lead smelter will not be considered complete without the adjunct of an electrolytic zinc reduction plant, if it is within reach of electric power at a reasonable rate. The competition of this by-product zinc will itself seriously affect the output of the retort smelters.

With proper adjustment of the roasting furnace conditions, it is not a difficult matter to obtain extractions of 90 per cent. from ores containing 15 per cent. to 25 per cent. zinc, and in the latter case with as much as 25 per cent. of iron. As far as the author's experience goes, furnaces of the Wedge and Herreshoff type are admirably adapted to the roasting of this class of ore. A large Wedge furnace, with seven hearths and a di-

ameter of 22 ft. 6 in. is capable of roasting about 1¼ tons of this ore per hour, with unskilled labor, and gives a more satisfactory product than the smaller hand-rabbed furnaces. After roasting concentrates containing 45 per cent. zinc, there is little difficulty in extracting as much as 95 per cent. to 97 per cent. of the zinc.

The successful electrolysis of zinc from sulphate solutions has not been an easy matter, and it is only within recent years that the difficult problem of depositing high-grade zinc has been satisfactorily accomplished on a commercial scale. The principal requisite is that the electrolyte shall be quite free from certain impurities. The methods by which freedom from these impurities is assured are now very well understood, and with experienced superintendence there is little difficulty in obtaining a high efficiency in that part of the process.

When certain underlying principles are recognized, the difficulty encountered in dealing with the filtration of the acid and slimy solutions also largely disappears, although it has been a very serious one to the uninitiated. In the dissolving of the zinc from the roasted ore there is nothing which any competent chemical engineer can not undertake, and any other operations connected with the electrolytic process are either of little or no difficulty, or are common to the retort process.

In comparing the two processes, I do not think there is any more experience required in the electrolytic process than in retort smelting, and I shall not be surprised if within the next year or two the electrolytic is preferred as the simpler of the two. It is certain that, with the exception of the care of the electrical machinery, the commonest unskilled labor only is required to produce electrolytic zinc, whereas the retort process requires not only many physically strong, but also very skilled and highly paid men. The amount of labor necessary in the electrolytic process is, however, greater than that required in retort smelting, and also, as a general rule, the current to produce a ton of zinc costs much more than the gas or fuel to produce a ton of spelter. The electrolytic is as much dependent on cheap power as the retort process is on cheap fuel. The operation of roasting in Wedge Furnaces is, however, less costly than that in the special furnaces used for roasting the ore for retorting, in which nearly all the sulphur must be eliminated. The labor and power costs are in favor of the retort process.

Just as soon as the lead or copper smelter recognizes that a good extraction of zinc can be made from his zinc-lead or copper ores, we may expect him to erect an electrolytic zinc plant as an adjunct to his smelter, even though the price of zinc should fall so low that he can make no direct profit from the zinc, provided, of course, that he is favorably situated with regard to cheap power.

In Canada, and especially in British Columbia, there are vast quantities of complex ores and silver-zinc-lead ores, which it has not been possible hitherto to concentrate to much above 45 per cent. The retort process in Canada is impossible on account of the small supply of ore of sufficiently high grade. The concentrates are impure and therefore do not command a high price. These concentrates are, however, very easily treated by the electrolytic process. It is imperative that the British Columbia miner shall concentrate his ore in order to separate the valuable silver-lead contents; the zinc con-

concentrates are merely a by-product. The latter generally carry a considerable quantity of silver, of which 65 per cent. to 70 per cent. is paid for the United States smelters, after first deducting 6 oz. The price paid for the zinc is generally based on 5-cent zinc, \$17.00 to \$18.00 per ton being given for 40 per cent. concentrates. After deducting duty, penalties and freight to the nearest United States zinc smelter, the Kootenay miner received only \$5.00 to \$7.00 per ton for his zinc concentrates. An electrolytic plant using these concentrates will prove to be a very serious competitor to the zinc smelter who can treat only high-grade concentrates. Even though he were able to treat 40 per cent. concentrates as profitably as 60 per cent., the Missouri miner could not supply his 40 per cent. concentrates to the smelter at much under \$27.00 per ton. The electrolytic plant would thus have an advantage of about \$20.00 per ton in the cost of ore, which much more than compensates for the higher cost of production in that process.

It must not be forgotten that when zinc-lead ore occurs in veins it must be concentrated in order to separate the more valuable lead contents, whether the miner is able to dispose of his zinc concentrates or not. Many of them actually run the zinc down the creeks because there is no market for it.

There are, of course, the considerations of cheap electric power, the improvement in flotation methods of concentration, distance from markets, and many others, which affect the future of these rival processes, but I think it must be conceded that it is at least very doubtful whether or not the retort process will be able to survive the competition of the electrolytic process within a few years.

In the early part of January only four of the eight blast-furnaces at the Granby Consolidated Co.'s smelter at Grand Forks, B.C., were being operated. The local newspaper stated that there was plenty of coke obtainable, but the supply of ore was short, temporarily.

MR. W. E. SEGSWORTH SPEAKS ON VOCATIONAL TRAINING.

Addressing a representative gathering of the Canadian Credit Men's Association in Toronto, Mr. W. E. Segsworth, Administrator of Vocational Training in connection with the Military Hospitals Commission, Ottawa, gave an instructive narrative of the work that is being accomplished in fitting the disabled soldier to provide for himself.

Mr. Segsworth announced that the department had branched out from the original scheme, and inaugurated a system of industrial surveys, which had been introduced in the vocational training schools as far West as Winnipeg during the past month with wonderful results.

In this connection, officials of the department visit the various industries, in which many different kinds of machinery are in use, and make a close study of the outstanding features of each machine and its mode of operation. The re-educational work is still in the experimental stage in Manitoba, while in the schools in Toronto and Montreal marked progress has been made.

The Silver Market

Messrs. Mocatter and Goldsmid, the London precious metal merchants, in reviewing the silver markets for the year say that the outlook is too uncertain for any definite prophecies.

"As last year," this firm writes, "we anticipate large requirements for coinage, both in India and in Europe, and the amount required will probably again exceed the world's products, but as indicating a tendency on the part of the Governments of the allies to avoid, as far as possible, further purchases of silver during the continuance of the war, it is interesting to note that early in October the Italian Government issued a decree calling in one and two lire pieces. France, too, has since decided to call in all five franc pieces coined up to the year 1870, and to demonetize these coins, using the silver for the coinage of subsidiary pieces.

"Owing to the entire absence for some time of any speculation in silver, the necessity of keeping large stocks of silver in London to prevent a possible 'corner' has disappeared, and although there was at the beginning of the year a stock of about 6,800,000 ounces this has been materially reduced, and is now almost negligible. Shipments, however, have arrived with wonderful regularity from New York and Canada, for with the exception of the steamship *Laconia* early in the year, and the *Mineota*, in September, no steamer bringing silver to London has, to the best of our belief, been lost; truly a wonderful record, and one for which we have to again thank the vigilance of our navy and those of our allies. The largest shipments of silver, however, have not been across the Atlantic, but on the Pacific side, owing to the enormous transactions with China, which have been such a feature this year. China has undoubtedly been a seller on balance during the past twelve months, over 39,000,000 ounces having been sent from there to India alone, in addition to minor shipments to other ports. Since these shipments from China have only been replaced to the extent of about 25,000,000 ounces imported from San Francisco, it gives an indication of the steady flow of sycee and other forms of silver which find their way to Shanghai from the interior of the country, the stock of sycee in Shanghai at present being hardly less than at this period last year."

Messrs. Heron & Co., members Toronto Stock Exchange, 4 Colborne St., have issued their annual (11th year) Summary of Mining Statistics. The publication, which has been prepared with great care and accuracy is a very comprehensive one covering useful data in connection with all Mining Companies, the shares of which were traded in on the Toronto market during 1917.

NIPISSING MINES CO.

With a silver yield of slightly more than 4,000,000 ounces Nipissing during the past year maintained its normal output, while the higher prices which prevailed increased the gross value over 1916. Dividends were as in previous year, 30 per cent.

Higher wages and cost of materials combined to raise the average cost above the 24.13-cent level of 1916, but the advance was probably more than compensated by the higher price received for silver.

NITRATES*

By Hoyt S. Gale.

Nitrogen for use in manufactures and in agriculture is supplied principally in the form of nitrates, and as these salts, or the nitric acid derived from them, constitute the basis of practically all explosives, they are absolutely essential also to warfare. As they are among the chief salts used in chemical fertilizers an adequate supply of them affects directly the quantity and the quality of the food supply.

Nearly all the sodium nitrate marketed is obtained from extensive deposits in the desert region of northern Chile. Commonly a few thousand tons of potassium nitrate is imported by America annually from India, where it is artificially produced in "saltpeter plantations." Calcium nitrate obtained in Norway by artificial fixation of the nitrogen of the atmosphere has also been listed among the fertilizer materials marketed in America. The United States has been the largest purchaser of Chilean nitrate since the German market has been cut off.

Just after the outbreak of the European war the Chilean nitrate industry experienced a severe depression which has, however, been followed by gradual recovery. The cost of production at the mines has risen considerably, owing largely to the increased cost of labor and the scarcity and high price of fuel. The coal used for refining the nitrate has been obtained principally from Wales as return cargo in the nitrate vessels. Fuel oil from California is also used.

At present the dearth of shipping facilities and high freight rates have considerably increased the price of the nitrate in the countries to which it is exported.

Nitrate of soda exported from Chile, calendar years 1912-1915, in short tons: 1912, 2,748,124; 1913, 3,018,469; 1914, 2,035,707; 1915, 2,230,054.

Normal New York quotations for sodium nitrate, 95 per cent. pure, ranged from \$44 to \$52 a short ton in 1912 and from \$44.40 to \$52.40 in 1913. At the end of 1916 or early in the spring of 1917 sodium nitrate was quoted at \$75 a ton in Atlantic ports.

The U. S. import figures show a war-time stimulus, the normal annual domestic consumption of about 600,000 tons of sodium nitrate increasing to more than double this amount in 1916. Of this large increase between 100,000 and 200,000 tons is believed to be in storage as a reserve for the time when access to a foreign supply may be cut off. The remainder of the increase, probably 600,000 tons, may be assumed to have gone into munition manufacture, chiefly for export.

The amount of nitrates consumed in fertilizers is not known exactly, but about 280,000 short tons (250,000 long tons) of sodium nitrate was used in 1916 for direct application to the soil as fertilizer. It is said to be applied chiefly as a top dressing, by itself, to promote or hasten growth at certain seasons, usually in the spring, after the crop has made a start.

A very important use for sodium nitrate is in the manufacture of sulphuric acid by the chamber process. In this process, by which the greater part of the acid of low gravities produced in this country is made, the nitric acid is required for the oxidation of the sulphurous gases to sulphuric form. The weight of sodium nitrate used in this way is estimated to be about 5

per cent. of the weight of the sulphur consumed to make the sulphuric acid. The production in 1916 of 4,500,000 tons of sulphuric acid of strengths less than 66 per cent. Baume therefore required 75,000 long tons (nearly 85,000 short tons) of sodium nitrate.

Fixation of Nitrogen.

The processes for fixation of atmospheric nitrogen that have been developed in a practical way may be classified as the arc processes, the Haber process, and the cyanamid process. Arc processes involve direct oxidation by means of the electric arc to form nitric acid and nitrates. These are fundamentally the simplest but are limited in application by the great amount of electric power required. Norway, with abundant water power, has been able to employ these processes successfully, but it seems doubtful if the power available in the United States could be spared for use in this way. The Haber and cyanamid processes form other compounds of nitrogen, which, however, can be converted into nitrates by a further process.

The Haber process consists in forcing gaseous nitrogen and hydrogen to combine under high pressure, a reaction being effected with the aid of a catalytic agent. This process yields ammonia, which would have to be converted to nitric acid, at least in part, to supply munition requirements, but which could be used in agriculture by conversion into ammonium phosphate or sulphate. This process, together with one for obtaining ammonia from cyanamid, is used at present in the production of nitric acid for munition supplies and inorganic nitrogen fertilizer salts in Germany, and these industries are believed to have been developed to such a degree as to render that country entirely independent of outside sources of nitrates when the war requirements cease.

The cyanamid process consists in the production of a compound of lime, nitrogen, and carbon, known as calcium cyanamid. It involves two main steps, each based on electric-furnace treatment but requiring only about one-fifth the power expenditure of the arc process. It is said that calcium cyanamid must be converted into ammonium salts to meet the requirements of nitrogen-carrying mixed fertilizer. An additional step would be necessary to convert the product to a nitric form.

By-product ammonia, derived from the production of coke and of illuminating gas, is an important source of combined nitrogen and is an available source for the production of nitric acid or nitrates. Such ammonia can be practically oxidized to nitrates, and the supply of this material is therefore available to relieve emergency requirements should other sources fail.

Mr. H. Freeman of the American Cyanamid Co., at a recent meeting of the Board of Trade of Niagara Falls, Ont., said:

"The establishment of the first, and at present only factory for the fixation of atmospheric nitrogen in America or the British Empire at Niagara Falls, Canada, by this company, was due to the failure of negotiations for the development of hydro-electric power in the United States, and to the cheap power offered at that time in Canada. When in 1913 capital was obtained in London for the extension of the industry to Alabama, where it was originally intended to go, similar conditions prevailed and the Canadian plant was extended by the expenditure here of some millions of dollars.

"Since the commencement of operations in 1909 the American Cyanamid Company has energetically sought the maximum development of the possibilities of cyanamid in many fields and at this plant a great amount of technical work has been carried on under the direction of Dr. W. S. Landis, and the use of cyanamid has been extended into many arts. The plant is up-to-date in every respect. Its employees are better paid than those of any other similar factory, and their welfare is taken care of by a very efficient safety committee, whose endeavors have made conditions of working far better than those in the majority of chemical factories.

"The raw materials used in the manufacture of cyanamid are the atmosphere, lime and coke, and to bring them into the proper combination a plentiful supply of electric power is required."

MORE ARSENIC NEEDED.

The shortage of arsenic and arsenic compounds that became apparent late in 1916 continued throughout 1917, according to a statement of J. B. Umpleby made public by the United States Geological Survey, Department of the Interior. It now appears that the United States needs about 12,000 short tons a year, whereas the available supply in 1917 only amounted to 9,787 tons.

In December, 1917, the manufacturers of insecticides, in response to a detailed canvass made by Mr. C. W. Merrill, of the Food Administration, estimated that they needed, for delivery before June, 1918, 6,900 short tons. Of this amount 5,476 tons had been contracted for and only 2,100 tons had been delivered. The manufacturers of sheep dip, in reply to inquiries made by the Department of Agriculture, estimated that they needed 1,000 tons. It is highly desirable also that some arsenic be exported to certain agricultural countries whose excess production is available to the allied governments. At present it is not known to what extent arsenic may be utilized in preparing poisonous gases for use in trench warfare.

The price of white arsenic in New York, as quoted by the Oil, Paint, and Drug Reporter, ranged from 8 cents a pound in January to 20 cents in May, and fell to 16 cents in December. Even at these prices, however, deliveries are said to have been far behind the stipulations of the contracts. It is understood that the maximum price for wholesale lots during the year was 16 cents a pound.

Last month The Trail News made the following comment: "During the recent strike at the Consolidated Mining & Smelting Co.'s smelter at Trail, B.C., the office staff had the time of their lives, albeit a new experience and a healthy one. Having completed totaling figures and making segregations re pachucas, motor generator sets, acids, metals and a few hundred other matters, they donned their overalls and went to work unloading cars of ore, coal, coke, etc. When that was done they increased their muscular exercise by loading pig lead and other metals of various kinds. While a bit strenuous at first, perhaps, it doubtless did them good and got them away for a time from their usual sedentary walks of life. And they never had better appetites, going back to their ledgers and adding machines when the strike was over with a new zest.

PERSONAL

Mr. J. B. Tyrrell, of Toronto, has been awarded the Murchison medal of the Geological Society, London, for recognition of his work as a geologist. Dr. A. P. Coleman, of Toronto, was awarded the medal a few years ago.

Mr. Van H. Smith has returned to Copper Mountain, B.C., from San Francisco, California, where he spent some time in the offices of Messrs. Bradley, Bruff & Labarthe drafting plans for the 3,000-ton flotation concentration mill to be erected and equipped by the Canada Copper Corporation at a site near Similkameen River, and about four miles above Princeton, B.C.

Mr. Oscar V. White, of Sandon, B.C., superintendent for the Slocan Star Mines, Ltd., has been ill as a result of ptomaine poisoning.

Mr. James J. Warren of Trail, B.C., managing director of the Consolidated Mining and Smelting Company of Canada, Ltd., in his last annual report, stated that the members of the company's staff on September 30, 1916, the end of the company's fiscal year, were as follows: Assistant General Manager, Mr. S. G. Blaylock; Metallurgical Manager, Mr. E. H. Hamilton; Manager of Mines, Mr. W. M. Archibald; General Superintendent of the Smelter and Refineries, Mr. F. N. Flynn; Comptroller, Mr. T. W. Bingay. The Manager of Mines stated that Messrs. M. E. Purcell, G. H. Kilburn, and H. L. Batten were engaged in examination and exploratory work, and that the operations of the various mining properties of the company were directed by the following other members of the staff: Centre Star and War Eagle, Rossland, Mr. E. G. Montgomery; Le Roi and White Bear, Rossland, Mr. F. S. Peters; Sullivan and St. Eugene, East Kootenay, Mr. J. K. Cram; Highland, Ainsworth, Mr. L. W. Oughtred; Molly Gibson, Nelson mining division, Mr. Ronald Stomier; Ottawa, Slocan City mining division, Mr. D. Matheson; Lucky Thought, Silverton, Slocan, Mr. D. M. Tattrie; Emma, Boundary district, Mr. Edward Nordman; Coast Copper Co., operating in Quatsino mining division, Vancouver Island, Mr. Wm. Clancy.

Mr. Wm. Thomlinson, of New Denver, B.C., who was employed by the Dominion Government to collect British Columbia minerals for inclusion in Canada's exhibit at the big expositions held in recent years at San Francisco and San Diego, California, and was in charge of the mineral exhibits at those big fairs, has contributed to The Daily Colonist, Victoria, an article in which he advocates that prospectors be certified after due training. Another of his contributions favors the employment of the Indians of British Columbia as prospectors.

ASBESTOS.

The demand for asbestos continues good and there is great activity at the Quebec asbestos mines. In addition to the regular producers several old mines have been reopened in the Broughton district.

GRANBY CONSOLIDATED.

For a winter month December established a record for the Granby Co. in the treatment at its Anyox smelter of 90,000 tons of ore.

Mineral Production of British Columbia in 1917

British Columbia's mineral production in 1917 aggregated in value \$37,182,570, compared with \$42,290,462 in 1916, a decrease from the latter year of \$5,107,892, according to figures compiled by Mr. W. Fleet Robertson, Provincial Mineralogist, and published in the annual preliminary review and estimate of mineral production, issued by the Department of Mines, just off the Government press. The detailed figures showing the production of various minerals and their value are as follows:

	1916		1917	
	Quantity.	Value.	Quantity.	Value.
Gold, placer.....		\$580,500		\$550,000
Gold, lode.....oz.	221,932	4,587,334	118,239	2,444,000
Total gold.....		\$5,167,834		\$2,994,000
Silver.....oz.	3,301,923	2,059,739	3,069,021	2,372,353
Lead.....lb.	48,727,516	3,007,462	38,661,811	3,054,283
Copper.....lb.	65,379,364	17,784,494	51,416,617	16,693,037
Zinc.....lb.	37,168,980	4,043,985	33,776,335	2,550,113
Total value of metalliferous.....		\$32,063,514		\$27,663,786
Coal.....tons	2,084,093	\$7,294,325	2,160,417	\$7,561,460
Coke.....tons	267,725	1,606,350	159,554	957,324
Total from collieries.....		\$8,900,675		\$8,518,784
Miscellaneous, building materials, etc.....		\$1,326,273		\$1,000,000
Total value of production.....		\$42,290,462		\$37,182,570

Summarizing the mineral situation throughout the past year, the report says:

"The decrease in total value of the 1917 mineral production as compared with that of the previous year would appear at first sight to show a very serious decline in the mining industry; this condition, however, was not due to any decline in mining itself, but to the cumulative effect of several adverse influences acting on the mining industry as a whole. It must be remembered that the year 1916 was a record one of demand for metals, which, therefore, made that year a banner one for mining, not only for British Columbia, but for the whole American continent. In comparing the estimated 1917 production with any previous year, excepting 1916, it is seen that the 1917 output easily exceeds any other; for instance, it is nearly \$5,000,000 greater than the former record year of 1912.

The adverse influences which retarded mineral production in 1917 may be summarized as industrial troubles, reduced metal prices in the last quarter of the year, a very much lessened demand for lead and zinc for munition purposes, and the economic conditions which severely handicapped the mining of gold.

"Industrial troubles in 1917 were more frequent and extensive than usual; in the early months of the year a protracted strike in the Crow's Nest district not only cut down the output of coal and coke but forced the copper and lead smelters to close for lack of fuel, and, as a direct cause, interfered with metal mining.

This strike was followed by another one at Rossland,

which stopped production from the big gold-producers of that camp.

"The great decrease in gold production this year is mainly due to the heavy falling-off in the Rossland output, which usually makes over one-half the yearly output of the Province. Early in November another serious strike occurred at the Trail smelter, which closed the whole plant until practically the end of the year; this in turn stopped productive mining during that time throughout East and West Kootenay.

"The reduction in metal prices was confined mainly to lead and zinc, as the average price for copper was practically the same as for the previous year, while

silver advanced in price. A larger production of lead, however, could have been made by the Trail smelter but for the inability to market the product, due to the curtailment of orders by the Imperial Munitions Board.

"Gold-mining suffered also from increased costs of labor and supplies, with no corresponding increase in the value of the metal produced, thereby causing a smaller margin of profit, and, in many cases, making it unprofitable to mine gold.

"But for these untoward circumstances the hope anticipated at the commencement of the year, that the mineral output of the Province for 1917 would reach the \$50,000,000 mark, would probably have been realized. Taken in the aggregate, our mineral production and development in the year 1917 and the future prospects of the industry are conditions for congratulation at this time.

"In 1914 the average market price of copper for the year was 13.6 cents; in 1915 it was 17.3 cents; in 1916, it was 27.2 cents; and in 1917 it was 27.18 cents. The 'high-water mark' for the year was in February, when the high monthly average of 31.75 cents a pound was reached; a steady, although somewhat irregular, decline thereafter set in. In September the United States Government, after conferring with the representatives of the big copper-producers, fixed a price of 23.5 cents a pound, and since that time this price has prevailed as the standard on the New York market; the New York price in turn is standard for the American continent, as sales and ore-purchases are governed

by it. This fixed price is apparently satisfactory to all, as the present supply and demand are about equal.

"The lead market is at the present time in a very dull and featureless condition. The high price prevailing for lead during the first nine months of the year so stimulated production that the supply soon exceeded the demand, with the natural result that stocks accumulated and the price commenced to decline. In Canada the chief producer of lead is the Consolidated company at Trail, which company delivered a large part of its output to the Imperial Munitions Board. Towards the end of the year, however, these orders were largely reduced, which caused the Trail company to have difficulty in marketing its lead; as a result the company had to curtail lead production.

"The high prices paid for zinc in 1915 and 1916 resulted in such an increased production that the supply far exceeded the demand, with the inevitable result that the market price declined very materially in 1917. The present market price of zinc of from 7.5 to 8 cents a pound cannot be considered as being any better than the before-the-war price, when it is remembered that operating costs are correspondingly higher. The average price of zinc for the year 1917 was 8.884 cents a pound (December estimated), which compares with 12.804 cents in 1916 and 13.23 cents in 1915. The Provincial output of zinc for the year 1917 is, however, only slightly less than in the previous year.

The value of coal produced in 1917 shows an increase of \$267,135 as compared with the previous year, but the coke production shows the large decrease of \$649,026. The coal production in the Coast District was considerably greater than in 1916, but labor troubles materially decreased the output in the Crow's Nest of both coal and coke; it is in this latter district that most of the coke production of the Province is made.

"As far as can be ascertained at present, there is a small decrease in the item of building materials, due to the cessation of building operations in the larger cities.

Gold production in all forms has suffered from the war, due to the increased cost of labor and supplies, while the price of the product remains stationary. Due to the greatly enhanced value of the baser metals such mines operating on the sliding scale of wages, regulated by the price of the metals, have been paying abnormally high wages, which have drawn miners away from the gold-mining, both placer and lode. The estimated production of gold, in ounces, for 1917, compared with 1916, was as follows:

Rosslund, 32,416-129,790; Boundary-Yale, 59,685-76,230; Nelson, 1,284-107; Skeena, 17,511-3,806; Coast, 2,612-3,204; Lillooet, 3,000-2,625; all other districts, 1,731-2,170. Total, 118,239-221,932 ounces. The fact that the Rosslund camp was closed down for a considerable portion of the year made a great decrease, as may be seen by the above figures.

Silver, while showing a decrease in quantity, was greater in value than in 1916 owing to higher prices for the metal, the high price being 100.74 cents in September, but since then dropping off to 85.5 cents, the average for the year being approximately 81.38 cents compared with an average in 1916 of 65.66 cents and 49.68 cents in 1915. The approximate silver production in 1917 was as follows: Slocan and Slocan City, 1,722,269 ounces; Skeena, 258,300; Boundary-Yale, 251,911; Ainsworth, 216,571; Fort Steele, 192,387; Coast, 128,648; Omineca, 104,838; Trail Creek, 51,508; all

other districts, 142,589. Total, 3,069,021 ounces. In the Slocan, which produced 56 per cent. out of the total silver output, the increase over 1916 was over 200,000 ounces and would have been larger but for the curtailed shipments of ore at different times owing to the inability of the Trail smelter to handle the ore. The largest producer was the Standard, with an output estimated at 374,000 ounces, followed by the Van-Roi, Queen Bess and Surprise, each over 200,000 ounces. The total number of shipping mines in that district was about thirty-five. Ainsworth and Fort Steele divisions showed decreases compared with the preceding year, while about 50 per cent. of the output of the Boundary district came from the Granby company's properties at Phoenix and the Skeena output was almost entirely from the Granby's Hidden Creek property at Anyox.

Lead showed a decrease of 10,065,705 lbs., but owing to increased prices the aggregate value of the output was \$46,821 over 1916, this 1917 output being the highest in the history of lead-mining in British Columbia. The high price in June was 11.181 cents a pound, declining to 6.25 cents in December. The average price for the year was 8.78 cents. By districts the output was: Slocan, 13,667,762 pounds; Fort Steele, 13,101,200; Ainsworth, 6,877,377; Nelson, 2,708,400; Windermere-Golden, 1,528,600; Revelstoke-Trout Lake-Lardeau, 410,700; Omineca, 287,672; all other districts, 80,100. Total, 38,661,811 pounds.

Copper production showed some falling off from the previous year, when the greatest output in the history of the Province occurred, but considering labor troubles, the year's results are deemed most satisfactory, the product being 6,416,617 pounds, valued at \$16,693,037, compared with the 1916 figures of 65,379,364, valued at \$17,784,494. But the 1917 output is the highest of any previous year but 1916. The average price of copper for the year was 27.18 cents compared with 27.202 cents in 1916. The district production was as follows: Skeena, 27,251,323 pounds; Southern Coast, 20,283,210; Boundary-Yale, 11,035,361; Trail Creek, 1,658,080; Omineca, 1,058,943; all other districts, 129,700. Total, 61,416,617 pounds.

During the past three years the report sets forth, copper mining has become the most important form of mining in British Columbia, and from all indications it should maintain this prominent place. Last year it formed 60 per cent. of the total value of the metalliferous mines and 45 per cent. of the total mineral production. In the working of the large low-grade deposits and subsequent smelting of the ores produced, a great number of men are employed and a large proportion of the money value is retained in the Province in payment of wages and purchase of supplies.

The gross production of coal was 2,402,410 long tons, of which 241,993 tons were made into coke, leaving a net production of 2,160,417 tons, a decrease from 1916 of 83,170 tons gross and an increase of 76,324 tons net. The quantity of coke produced was 159,554 tons, a decrease of 108,171 tons from 1916. The provincial coal production was divided as follows:

Vancouver Island	1,698,235
Nicola	151,817
Crow's Nest Pass	552,358

Coke production was: Vancouver Island, 30,399 tons; Nicola, nil; Crow's Nest Pass, 129,155. Total, 159,554 tons.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

Published estimates of the total value of the mineral production of British Columbia for the calendar year 1917 range from \$37,500,000 to about \$41,300,000. The former amount is stated to be the latest estimate of the Provincial Mineralogist. The opinion of the Journal's correspondent, who, by the way, has not obtained any production figures from mine-owners other than those made public by the Trail smelter officials, is that it is just as likely as not the final returns will show even the lower estimate of the Provincial Mineralogist to have been somewhat high.

While these notes are being written before the date of the annual general meeting, in Toronto, of shareholders in the Consolidated Mining and Smelting Company of Canada, Limited, the results of the company's operations in its fiscal year ended September 30, last, are known, and it is gratifying to find that the total value (\$13,020,127) of the metals produced at the company's smelter at Trail was so much higher than in any previous year, and that a net profit of \$1,076,828 had been earned in the fiscal year, during which the total of dividends paid to shareholders (\$995,012) was also larger than in any previous year. It may be of interest to add that the total quantity of ore treated from the time the smelter was established in the early part of 1896 to September 30, 1916, was 5,626,324 tons, and that the quantities of metals produced and their total gross value were as follows: Gold, 1,877,235 oz.; silver, 29,290,981 oz.; lead, 498,309,934 lb.; copper 79,583,490 lb.; zinc, 23,058,996 lb.; gross value, \$102,207,303. The total of dividends paid during the same period is \$3,946,360.50, of which sum a little more than one-fourth was paid in the last fiscal year. It is recalled that Mr. S. G. Blaylock, the company's assistant general manager, when giving information concerning the Trail smelter and refineries in the course of an address made at the International Mining Convention held in Nelson, West Kootenay, B.C., last May, said: "The Trail plant is probably as complete a metallurgical institution as there is on the North American continent. Of course I do not say that it is by any means as large as some other plants, but we are working about sixteen hundred men, and are making electrolytic copper, copper sulphate, electrolytic lead, lead pipe, shrapnel, wire, electrolytic zinc, refined gold and silver, sulphuric acid, and hydrofluosilicic acid." The outstanding features of the last two years' operations are the successful establishment of an electrolytic copper refinery, the standardizing of the electrolytic zinc process and the completion of the electrolytic zinc refinery and latterly the increasing of output of refined spelter to more than sixty tons a day; also the establishment of the acid-making plants. Labor difficulties having been overcome, it is earnestly hoped that the current year's operations and results will be successful and satisfactory.

The following is a clipping from the Nelson Daily News of January 11: Nelson Board of Trade proposes to make a protest against the 10 per cent. income tax which has been imposed by the Provincial Government on mining companies of the province, it was intimated at the meeting last night. The details of the matter will be gone into later and the resolution presented to the Associated Boards of Trade convention in Nelson next month. Mr. Fred A. Starkey last night said the

tax would work a great hardship and recalled that last year Hon. William Sloan, Minister of Mines, had promised that there would be no increase of taxation of mines.

EAST KOOTENAY.

Work has been resumed at the Consolidated Mining and Smelting Co.'s Sullivan lead-zinc mine, which was closed in November when the Trail smelter employees went out on strike. During the first week of January there was received at Trail 1,188 tons of zinc ore from the Sullivan.

Approximate figures of the quantity of coal produced at Crow's Nest district collieries in 1917 show a total of about 559,000 long tons gross, that is including the coal made into coke. This quantity compares with 882,270 long tons gross for 1916. The decrease of fully one-third in output is, of course, the direct result in largest degree of the miners having been on strike for several months, and in a smaller extent of the occurrence of disasters at some of the mines of the Crow's Nest Pass Coal Co.

WEST KOOTENAY.

Ainsworth—Shipment of ore from mines in Ainsworth mining division has been small since the strike of the workers at the Trail smelter. The Bluebell shipped 342 tons in December, and during the first week in January 41 tons of zinc ore from the Bell mine, in Jackson basin, also reached the smelting works.

Much prominence has been given in newspaper columns to a proposal involving the purchase of the Sunset and Bell mines by the Utica Mines, Ltd., for \$70,000 cash and 800,000 shares in the company, which was approved at a meeting of shareholders held in Kaslo on January 5, which meeting also authorized an increase of the company's capital from 2,000,000 to 3,000,000 shares of \$1 each, par value. Meanwhile district newspapers report that mining has been suspended at the Utica mine, and that it is understood there is no money available at present for continuance of operations.

It is stated that thirty men are employed on the Consolidated Mining and Smelting Co.'s No. 1 silver-lead mine, in Ainsworth camp. There are other properties in the division on which work is being done, but generally there will be little ore production until such time as shipment to Trail shall again be permitted.

Slocan.—A meeting of shareholders of the Slocan Star Mines, Ltd., has been called to consider a proposal to wind up the affairs of the company, the accounts having shown a loss of \$38,700 as the result of operations during the fiscal year ended October 31. last. The company is reported to have ore valued at \$18,000, but the suspension of ore-buying at Trail has prevented realization.

The authorized capital of the Lucky Jim Zinc Mines, Ltd., is to be increased from \$2,500,000 to \$6,000,000. The purpose of the increase, it has been announced, is to absorb \$125,000 in bonds outstanding, discharge other obligations, and provide a surplus of treasury stock for sale to raise money for improving the mining property.

Following the report that a shoot of ore nine feet wide had been encountered on the 150-ft. level of the Galena Farm silver-lead-zinc mine, near Silverton, Slocan lake, it is stated that there is sufficient ore in sight to supply the concentrating mill with 100 tons daily for a period of six to eight months. Operation of the

concentrator will be resumed in March; meanwhile further development of the mine is in progress.

The ore shoot recently encountered on its property adjoining the Slocan Star mine has been developed by the Noonday Mines, Ltd., for 40 feet and its width found to be 8 ft. along that distance. About 12 in. of the ore is of shipping grade and the remainder suitable for concentrating. It is likely the latter will be concentrated at the Slocan Star mill, nearby.

Trail.—On January 4 the Trail News gave some information relative to conditions at the Consolidated Mining and Smelting Company's smelting works and refineries at Trail, in part as follows:

"Trail's extensive reduction works are once more getting back into their old form since the resumption of operations on December 21. Three or more furnaces are in operation, with others soon to be in blast; the zinc plant is practically in full swing, having turned out about 30 tons of spelter yesterday, and the copper refinery is being put into shape for again separating the gold and silver from the copper and producing the pure red metal. The concentrator and acid plants are also being operated.

"A little later the lead refinery will doubtless be again placed in commission, especially if some method can be worked out by the management for disposing of the lead product—a matter of no little importance not only to Trail, but as well to every silver-lead and lead-zinc mine in the Kootenay districts. The accumulation of pig lead that was on hand in November has practically all been shipped to market.

The total quantity of ore received at the Trail smelting works in 1917 was 347,614 tons, of which about 243,000 tons was from mines operated by the company and the remainder was of custom ores. The total for 1916 was 486,688 tons, so that there was in 1917 a decrease of 139,074 tons or 28 per cent., which was largely accounted for by there having been 187,000 tons less ore sent to Trail from the company's Rossland mines, with a partial offset of mines in East Kootenay.

VANCOUVER ISLAND.

The available supply of custom ore has proved too small to allow of the smelting works at Ladysmith to be continued in operation, so suspension has been found necessary. It is unlikely smelting will be resumed here until several months hence. Meanwhile efforts are being made to develop more ore and to arrange for its shipment to the smelter.

The gross output of coal from Vancouver Island collieries in 1917 is stated to have been 1,698,235 long tons, as compared with 1,492,761 tons for 1916. The proportions from the mines of the several companies are as follows: Canadian Collieries (Dunsmuir) Limited, 800,348 tons; Western Fuel Co., 658,001 tons; Pacific Coast Coal Mines, Ltd., 150,517 tons; B. C. Mining Co. (formerly Vancouver-Nanaimo Coal Mining Co.), 61,547 tons; Nanoose Collieries, 27,822 tons.

OMINECA.

The plan to haul ore from the Babine Bonanza Mining and Milling Co.'s property, in the Babine range, to the Grand Trunk Pacific railway at Telkwa, a distance of about sixteen miles, has been abandoned for the winter, the newly-made road being too soft to allow of heavy hauling being done over it. Mr. James Cronin, of Spokane, Washington, for many years manager of the St. Eugene lead mine in East Kootenay, but now at the head of the Babine Bonanza company, is re-

ported to have bonded what is known as the Sweeney properties, situated in the Sibola district, south of the G.T.P. railway. These claims are distant from the railway about fifty miles, but as there occurs on them some remarkable showings of silver-lead ore, development work will be done on them as soon as shall be practicable.

The Silver Standard Mining Company recently completed a contract it had entered into to ship ore from its mine on Glen Mountain, near Hazelton, to the Selby smelter, near San Francisco. It is understood that the ore thus shipped was silver-zinc ore. An idea of the metal contents of this kind of ore is given in an official report which states that in 1916 there was shipped from this mine to the United States, 209 tons of zinc-silver ore containing 168,616 lb. of zinc and 12,647 oz. of silver. The quantity of silver-lead ore shipped from the mine to the Trail smelter in 1917 was 366 tons as compared with 738 tons in 1916. Returns for 651 tons in 1916 gave gold 126 oz., silver 74,593 oz., and lead 162,051 lb. Arrangements have been made to put in a concentrating plant to treat the Standard ores and the machinery was recently at Prince Rupert on its way to Two-mile creek, where the mill buildings have been erected to receive it.

DAWSON MEN FIND COPPER.

Whitehorse, Yukon, Dec. 28.—A rich strike in copper ore has been made on Williams creek near Yukon Crossing, by Dawson men. A tunnel has been run into the hill 180 feet, and now the lead is being penetrated with splendid ore all the way. Joe Viau and Martin Berrigan, who are working on the ground this winter write the good news of the strike, and say they will have a good deal of the ore on the dump by spring. They write to Paul Guite and Dr. Lachapelle of this city, the heaviest owners in the property. Viau and Berrigan are working the property under special agreement.

Mr. Guite and Dr. Lachapelle have spent thousands of dollars on the development of the property, and deserve great credit for their persistence in opening the resources of the country. Mr. Guite has held interests there much longer than any others and has made the heaviest expenditures.

The strike is one of a group of ten copper claims lying on Williams and Merrit creek. The tunnel is on Williams creek, only three-quarters of a mile back from the steamboat landing on the main Yukon river, and four miles below Yukon Crossing.

Writing from Williams creek to Mr. Guite, Mr. Berrigan, in a letter just received, says:

"I am glad to tell you that the rock is showing up fine. We have two pieces here on the table to-night almost pure copper. Yes, she sure is looking good. Joe is just tickled to death. He is the happiest man you ever saw since the days of '98. Joe says that despite all the knockers we got a mine at last and you could not buy him out now for love or money.

"As we have to follow the hanging wall we cannot tell the width of the lead as it is all copper the whole width of the tunnel, so we can't tell how wide it is to the foot wall. But after we get the 100 feet we will crosscut to the foot wall to see how wide it really is. It is sure a big thing as it looks at present. You can see lots of solid chunks of the pure mineral coming out on every wheel barrow load. It is sure a big surprise to Joe, as you know when we struck the lead at first

as I was telling you in Dawson, there was no mineral in sight. It was not until we got in 10 feet on the lead that there appeared occasionally small signs of mineral. But she came in a rush at 20 feet. It was all copper, so I hope it will keep on getting better, as it has been since we hit the copper. I know Paul, you will feel good over this, as you told me you spent \$9,000 on this property. I think you are a lucky man. If you could see the face of this tunnel shining with copper you would think so too.

"We have lots of copper if we could convert it into money, but we can't do that just yet."

In another letter received by Dr. Lachapelle and written Nov. 11, Joe Viau writes:

"We got through the granite and now are in the lead, and have good indications of ore in the foot wall from which I enclose a couple of samples. Thank the Lord I am now on the down hill pull and I don't think you will have any more kick."—Weekly Star.

LAKE SUPERIOR DISTRICTS SHIPPED 64,275,000 TONS IRON ORE IN 1917.

The iron ore mined in the United States in 1917 amounted to about 75,324,000 gross tons, compared with 75,167,672 tons in 1916. The shipments from the mines in 1917 are estimated at 75,649,000 gross tons, valued at \$236,178,000, compared with 77,870,553 tons, valued at \$181,902,277 in 1916, a decrease in quantity of 2.9 per cent., but an increase in value of 29.8 per cent. The general average value of the ore per ton at the mines for the whole United States was therefore \$3.12 in 1917, as compared with \$2.34 in 1916.

About 85 per cent. of the ore mined in 1917 came, as usual, from the Lake Superior district, which mined about 63,964,000 gross tons and shipped 64,275,000 tons, these quantities representing a very slight increase and a decrease of 3.2 per cent., respectively, compared with 1916. The shipments of iron ore by water from the Lake Superior district, according to figures compiled by the Lake Superior Iron Ore Association, amounted in 1917 to 62,498,901 gross tons. It thus appears that the iron-mining industry in the Lake Superior district has been able to bear the strain of the war demand, but not to duplicate the great record of ore shipments made by Lake in 1916, which amounted to 64,734,198 gross tons. The slight falling off, it is understood, was due to less favorable weather for shipping early and late in the season of 1917 rather than to inability of the Lake fleet to handle the ore mined.

BOOK REVIEW.

Eye Hazards in Industrial Occupations (Octavo, 150 pp., illus.) By Gordon L. Berry, Field Secretary, National Committee for the Prevention of Blindness, with the co-operation of Lieut. Thomas P. Bradshaw, U. S. Army, formerly Technical Assistant to the Director of the American Museum of Safety. Published by the National Committee for the Prevention of Blindness, 130 East 22nd Street, New York. Price, 50 cents.

In this volume the author reviews the chief industrial hazards to eyesight in the industries of the United States. Case reports illustrate each section, the special dangers are described and recommendations made for such changes of working conditions, or installations of protective devices, as have been found suitable for protecting workers. The book is most completely illustrated.

DEVELOPMENT OF THE MURRAY-MOGRIDGE GOLD MINE.

Among the mining properties under active development in the Kirkland Lake gold area is the Murray-Mogridge, situated at Wolf Lake. Results of development at this property are very encouraging. Mr. G. S. Harkness has given us the following notes on operations to date:

The property, four hundred acres in extent, was acquired by the Murray-Mogridge company about a year ago. Last spring mining plant was installed and underground development commenced.

Two shafts have been sunk on Vein No. 1 about 2,600 ft. apart; the South or No. 2 to a depth of 240 ft., and the North or No. 1 to the 50 ft. level. Stations have been cut and the orebody opened up at the 50, 100 and 200 ft. levels from the No. 2 shaft, and within a short time the 300 ft. level will also be ready for lateral workings.

The vein system in all the workings ranges from 3 to 20 ft. in width, and average values from careful channel sampling on the different levels show the following results: Surface \$8; 50 ft. level \$12; 100 ft. level \$11 and 200 ft. level \$16.40 along the 175 ft. of drifting to date. Recent sampling near present faces shows the highest results yet obtained, values ranging from \$16 to \$60 across the full width of the drift with only one wall showing, while special samples from a rich streak along the foot wall gave high returns of \$600 to \$822 per ton.

The North or No. 1 shaft will also be continued to the 300 ft. level and after opening up the No. 1 vein at this point a crosscut will be run to the East to pick up No. 6 vein which was uncovered last fall. This vein stripped some 90 ft. and sampled every 3 ft. gave an average of \$13.20 across 5 ft. of ore. Four other veins carrying good commercial ore have been uncovered and trenched for a considerable distance. The property, conveniently located, is well equipped with all necessary buildings, machinery, etc.

OBITUARY

James May, the oldest prospector in Northern British Columbia, died recently at Hazelton. In a lengthy notice contributed to a Prince Rupert newspaper the following occurs: "James May was among the stamperers of the Fraser River excitement, and among the first in the greater stampede that followed to the Cariboo diggings. But as the outcome of these frolics he staked some claims on Tom Creek, in the Omineca, and despite the known propensity of old-time prospectors to drop everything on the rumor of a new strike, Jim stayed with these placer claims of his on Tom Creek—stayed with them for more than fifty years. A great gaunt figure was James May. His death removes a figure of the landscape in the Omineca diggings. Six feet two he was, broad and sinewy, wearing a closely trimmed beard these many years and always a smile and an open hand for every deserving creature, human or animal. Hard callous handed as he was, he was always the Kentucky gentleman."

The Pathfinder Consolidated Mining Company has been organized to acquire the Pathfinder and Little Bertha mining properties, in Grand Forks mining division of British Columbia. In earlier years the Pathfinder shipped copper ore, but the price of copper was then too low for operation of the mine to be profitable.

CARBON BRIQUETTES

Mr. W. J. Dick, of the Commission of Conservation, says:

To save from 45 cents to \$2.50 per ton is a possibility for the anthracite coal users of the prairie provinces. In 1916, Canada imported 4,570,000 tons of anthracite coal, nearly all of which was used for domestic purposes. Of this, about 400,000 tons were shipped to destinations in Manitoba and west thereof for domestic use. As the eastern portion of Saskatchewan forms the competitive area between supplies of United States coal on the one hand and the high grade bituminous coal of the Rocky Mountains on the other, the cost of coal in that portion of the province is high.

An investigation undertaken by the Commission of Conservation in co-operation with the Advisory Council for Scientific Research shows the economic possibility of manufacturing a high-grade fuel from the lignites of Saskatchewan. The results are published in the pamphlet "Carbonizing and Briquetting of Lignites." Carbonized lignite briquettes are stated to be practically equal in heating value to anthracite coal. They will, therefore, stand comparison very closely on the basis of cost. The difference in favor of briquettes as compared with anthracite coal varies from 45 cents per ton at Portage la Prairie to \$2.50 per ton at Moose Jaw. This allows a profit of \$1.00 per ton to the producing plant having a capacity of 30,000 tons per annum. With a capital cost of \$400,000, this would return 7½ per cent. on the investment. The lower price of carbonized briquettes would mean a large saving to consumers in western Manitoba and Saskatchewan and a plant such as that referred to would save some \$225,000 to the country annually which is now being paid to American coal producers.

FRENCH CONTROL OF METALS.

France is taking steps to ensure the economic development and control of her mineral and metal industries after the war. A company has been formed, entitled the **Societe Minerais et Metaux**, with a capital of \$2,000,000 for the purpose of fostering and protecting the metal industries of the country. The company, which is representative of existing interests, is not a profit-making enterprise so much as an organization which has for its object the improvement and extension of the methods of distribution, treatment, and marketing of the metals produced in France and her colonies.—W.J.D.

PRINTING AND PUBLISHING

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

MINE HOISTS and BUCKETS

One Mining Company is now operating seven of our Mine Hoists.

Need we say any more as to their reliability.

We supply them either with boiler, as shown, or without boiler, but with engines for steam drive. We also make them for electric drive, or for gasoline drive, as desired.

We make these Mine Hoists in 7 sizes, from the little 10 H. P. size for prospecting or for small mines, to the heavy duty 50 H. P. machines.

Any size made with one, two, three or more drums.

MARSH & HENTHORN Limited, BELLEVILLE, ONTARIO

Contract, year 1918, \$25.00.

Silver (official), 88%.

Metal Products.—The following quotations represent mill prices and are strictly nominal except in the case of lead sheets and sheet zinc:

Sheet copper—Base prices—

Hot rolled, \$31.50—33.00.

Cold rolled, 32.50—34.00.

Copper bottoms, 39.50—41.00.

(Shipments from stock 2c per lb. extra.)

Copper rods—Base prices—

Round, 32.50.

Sq. and rectangular, 33.50.

Copper wire—Base prices—

Nominal, 27.00.

Brass Products—Base prices—

High brass—

Sheets and wire, 27.50—29.50.

Rods, 24.75—26.75.

Low brass—

Sheets and wire, 30.00—32.00.

Rods, 30.75—32.75.

Brazed tubing—

Brass, 34.75—36.75.

Bronze, 39.75—41.75.

Seamless tubing—Base prices—

Brass, 35.50—37.50.

Copper, 38.00—40.00.

Bronze, 42.50—43.50.

Full lead sheets, 9.25.

Cut lead sheets, 9.50.

Sheet zinc, f.o.b. smelter, 19.00.

USED Equipment, But NOT ABUSED

Oxy-Acetylene Welding and Cutting

This welding repair on broken crank shaft saved an expensive tie-up, at a cost of 50c.

Reduces Repair Costs Saves Time and Money

Oxy-Acetylene Welding is saving hundreds of thousands of dollars annually in Canadian Factories, Mills, Mines, Machine Shops and wherever metal or machinery is used. Broken machinery parts, tools and defective castings are quickly and permanently repaired. Many economies and advantages are derived from welding in construction as well as in repairing.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Address Dept. C-108.

World's Largest Makers of Dissolved Acetylene

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area, contains many millions of acres in which the geological formations are favourable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1916 produced 45 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1916 to be worth \$65,303,822, of which the metallic production was \$55,002,918.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

For list of publications, illustrated reports, geological maps and mining laws, apply to

HON. G. H. FERGUSON,

Minister of Lands, Forests and Mines,

Toronto, Canada

Why is the cost so low?

The WILFLEY CONCENTRATING TABLE sells at a lower price than other tables for the reasons that it is extremely simple in construction; is absolutely standardized, all parts being interchangeable, and is manufactured in large numbers.

Latest Model
No. 6 Wilfley Table

The WILFLEY was the first successful concentrating table. It is still the best. The mechanical perfection of the WILFLEY is evidenced by the fact that in a score of mills WILFLEY TABLES, bought twenty years ago, are still in daily operation.

The WILFLEY occupies less floor space than other tables. The latest type is equipped with improved head-motion, adjustable wash-water and feed-box, improved tilting device, steel-frame with slipper-bearings, and new draw-bar which distributes strain over three pressed-steel stringers.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

- Fuel Testing Laboratory.**—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.
- Ore-Dressing Laboratory.**—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.
- Chemical Laboratory.**—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.
- Ceramic Laboratory.**—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.
- Structural Materials Laboratory.**—Experimental work on sands, cements and limes is also undertaken.
- Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to **The Director, Mines Branch, Department of Mines, Ottawa.**

Punch Out Your Hollow Drill Steel

quickly, cheaply, almost automatically, as shown in these illustrations, with a little

Sullivan "DB13" Air Hammer

In sharpening and shanking hollow drill steel a punch for finishing the hole is almost indispensable.

The new Sullivan Punch operates as follows:—

Clamp the the tool in any convenient position, so that the handle is solid and the body loose. Connect the inlet to a half-inch air hose, insert a taper punch in the chuck, and you are ready for work. A retaining sleeve holds the punch in place.

The push throttle uses air only while the tool is actually running. It can be attached to any sharpener, or set up in any hand-smith shop where air power is available.

Ask for Bulletin 672

Sullivan Sharpeners are particularly adapted for working hollow steel—

1. The heat required is short and closes the hole less than with other machines.
2. The method of dollying makes a long hole. No danger of splitting.
3. The gripping dies hold the bit or shank in perfect alignment with the dolly pin, so that the hole is in the exact centre of the steel.
4. The hammer process permits slow or fast, light or heavy blows to be delivered at will, assuring careful handling.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

A New "Little David" Grinder

For Squaring Off Rock Drill Shanks,
Dressing Rock Drill Bits and Reaming
the Hole in Shanks of Hollow Drill Steel.

*Saves Piston Breakages
Keeps up Cutting Speed*

*"Little David" Pedestal
Grinder No. 8.*

The "Little David" Pedestal Grinder will help you to get and maintain the greatest practicable freedom from drill stoppages due to broken drill shanks and pistons, as well as to get the best action when using water and hollow steels.

This grinder may also be used for general grinding purposes

This is a new tool for mine use which adds greatly to the efficiency of drill sharpening equipment. While the drill sharpener insures a plentiful supply of sharpened steel, properly formed shanks have much to do with the final results in footage.

*Let us send you Bulletin 4041 which tells
the whole story. Other bulletins are yours
for the asking also.*

INCREASED PRODUCTION

A Necessity—and a Patriotic Duty

With the present shortage of labor in the Canadian market and the vital necessity of increasing our mineral production to its utmost capacity, labor saving and high efficiency machinery and equipment must play a prominent part.

With the use of a "New Cleveland" Stoper you can increase your output and yet cut the cost of your drill upkeep. It multiplies the efficiency a thousandfold. Its drop forged parts of simple design which are practically unbreakable, give you economy in time and repairs; also the air consumption is low because of the "Pocket-in-head."

Give us an opportunity of proving these facts to you. There will be no obligation on your part.

CARBIDE LAMPS

WORK WITHOUT WATCHING

"Time's like money—the less we waste, the further we make it go."

When a miner stops to regulate his lamp he must stop his regular work—time wasted—the same when he stops to recharge.

ITP lamps never need regulating. The Float Feed automatically rakes the carbide, and as they burn from 9 to 10 hours they never require recharging during a shift.

COBALT, HAILEYBURY, SOUTH PORCUPINE, TIMMINS

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167 603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

The annual meeting of the Canadian Mining Institute will this year be held in Montreal on March 6th, 7th and 8th. Many important matters will be discussed and it is to be hoped that members will make every effort to be present. Canadians cannot afford to neglect such an opportunity to get together and talk things over. The mining men of the country have a duty to perform and they realize it more fully when they hear and take part in discussions on what is being done towards increasing production of minerals for war purposes and for maintaining Canada's credit now and after the war. If you attend this meeting and take an interest in the discussions you will doubtless make useful criticisms and suggestions. Don't be misled by the supposition that these meetings are unnecessary or undesirable in wartime, because they happen to be enjoyable functions. They are more useful now than they ever were, and you owe it to yourself and your country to attend.

During the past seven years Canada has had eight so-called Ministers of Mines. It is a pleasure therefore to record that there are signs that we now have a real one. We have, unfortunately, to be satisfied for the present with only half the attention of the new minister, for he also holds the portfolio of Secretary of State. Half the time of a capable minister will, however, be more than we have had for some years.

Hon. Martin Burrell, Minister of Mines and Secretary of State, has reason to be proud of his record as Minister of Agriculture. He has a good opportunity for showing again his ability as an organizer. His predecessors gave little attention to the business of the Mines Department and the Cabinet utterly failed in its duty to the mining industry. We expect that the new Cabinet and particularly the new Minister of Mines will make some effort to inform themselves as to the best means for speeding up the development of our mineral resources. Mr. Burrell will not have to do very much to surpass the efforts of those who preceded him. We do not believe that he will be content to be classed with them. He is not unfamiliar with the mining industry and as head of the Department of Agriculture he made a reputation that leads us to hope for much.

The fuel shortage has naturally directed much attention to fuels other than coal. Plans are being made to utilize peat, and an unusually large amount of wood is being burned. It would be well, however, for the public to realize that North America has plenty of good coal for immediate needs and that the real problem is one of transportation. There is, of course, a shortage of labor, but the great cause of shortage at points of consumption is inability of the railway companies to take the coal quickly from the mines to the consumers. We should cut out the long hauls where they are not necessary. Canadian coal in east and west should be more fully utilized in both Canada and the United States. Americans who think that central Canada gets too much coal from the United States, will do well to consider who is responsible for the failure to more largely use Canadian coal in northern Atlantic and Pacific States. In Nova Scotia we have great coal mines right on the sea, admirably situated to supply Boston and nearby ports. We have similar conditions on the Pacific coast. In Ontario we have no coal; but are close to great United States coal fields. By more complete utilization of our Niagara and St. Lawrence water powers Ontario should be able to get along without much coal for power purposes; but will be glad to have American coal for heating purposes.

We would suggest that the Fuel Controllers of the United States and Canada could help relieve the coal shortage by doing what they can towards increasing reciprocity in the use of coal and, if necessary, in the supply of labor and transportation facilities. They will do well to enquire into the conditions which have prevented the proper utilization of Canadian coal in Manitoba and North Western States. They will do well to consider whether Nova Scotia coal could not be more extensively used in New England and on the Atlantic.

Oil Prospecting in Southwestern Ontario*

By M. Y. Williams.

To-day it is self evident that Canada needs petroleum. America needs petroleum, the world needs petroleum, alike for war-time and the more peaceful endeavors. This need is manifest in the rising cost of all petroleum products, and the result has been a great impetus to oil prospecting. At the present time, America is drawing on its stored surplus of petroleum and petroleum products.

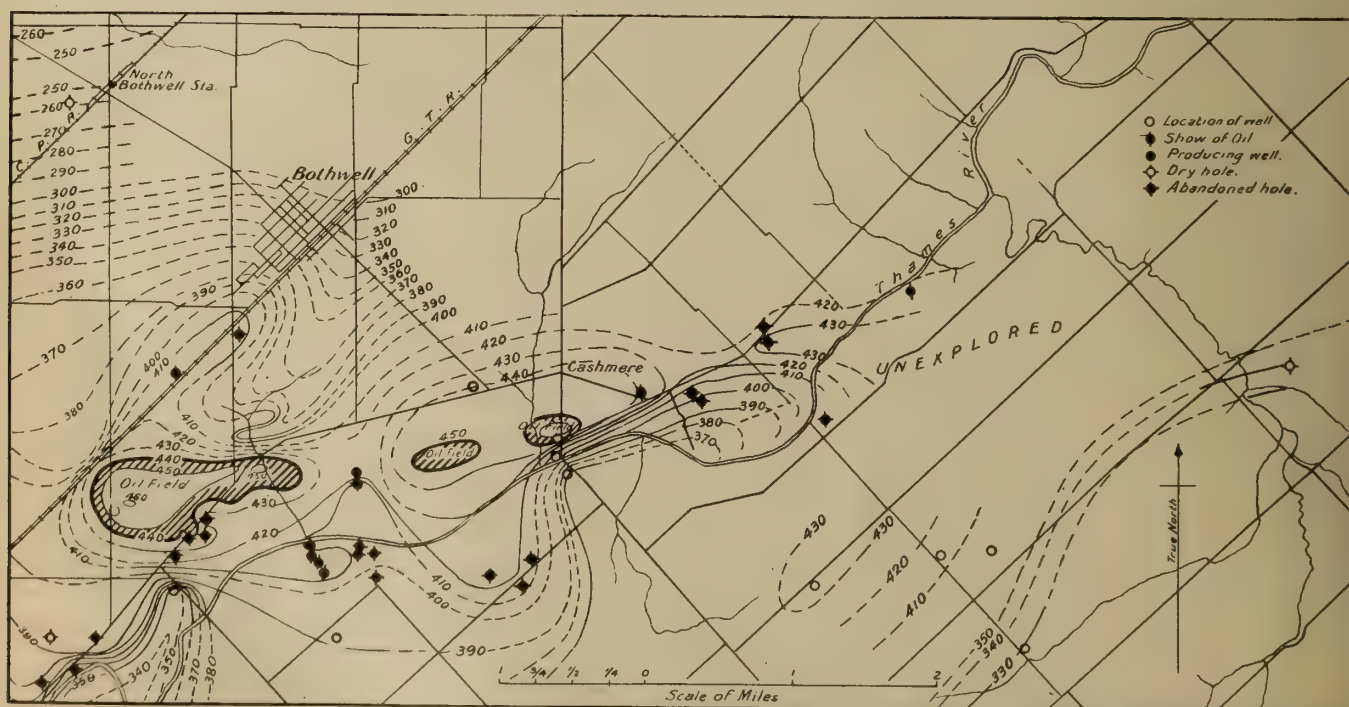

Let us examine the conditions of our Canadian supply. In 1916† Canada paid bounty on 198,123 barrels of crude petroleum valued at \$392,284 which may be taken as the total production exclusive of the small amount of light oil produced in Alberta, which is too low in specific gravity to draw Government bounty. Of the oil upon which bounty was paid, New Brunswick produced 1,345 barrels, and Ontario 196,778 barrels. The value of the total exports of petroleum and its products amounted in 1916 to \$73,771, and of the total imports to \$14,701,521. From the above the urgent need of an increase in our petroleum production is clear, and renewed prospecting is a reflection of the need.

What are the results in Ontario to date? Taken altogether, it is too soon to predict what the real results of the present efforts at increased oil production will be, as these will doubtless be cumulative and spread over several years to come. However, an abandoned prospect north of Glencoe, in Mosa township, Middlesex county, has been turned into a producing oil field by the Ontario Petroleum Company under the careful scientific management of F. J. Carman, of Bothwell. The oil produced here is from the Onondaga (Corniferous) limestone. In Dover West township, Kent county, a well drilled in to the Trenton limestone by the Union Natural Gas Company is changing from a gas well to an oil well, and is producing considerable

quantities of petroleum. Other areas are being tested by the drill and the results will be learned in due time.

Besides the Onondaga (Corniferous) limestone which is the principal formation producing petroleum, the lower Salina and upper Guelph dolomites are producing oil in southwestern Kent, and the eastern part of Essex county. Near Brantford some oil is produced from the Queenston shale just below the Medina (Whirlpool) sandstone. The deepest petroliferous formation is the Trenton limestone which is known to contain some oil on Manitoulin Island, at Milton, and in West Dover township, Kent county. This formation, which is now being tested near Rockwood in Dover township, at Flesherton, at Rondeau and elsewhere, has produced great quantities of oil in Ohio, and is looked upon by Ontario prospectors as a possible source of supply.

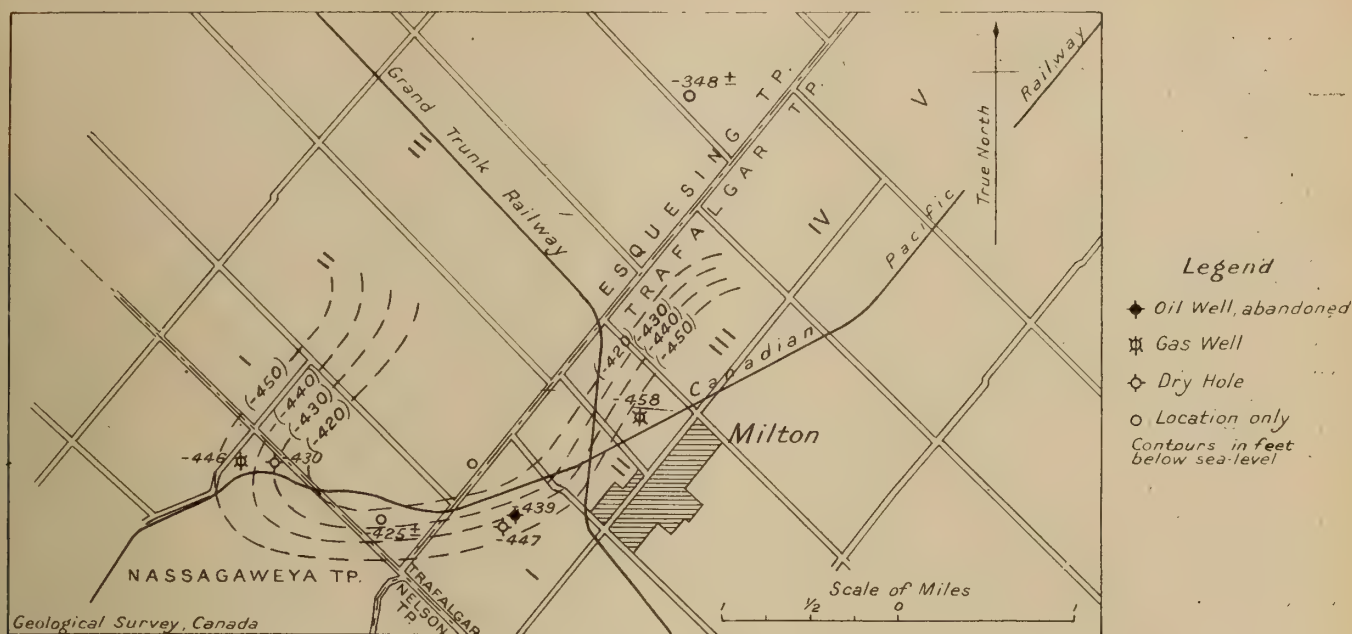

Times have changed in the petroleum industry from the 'sixties, when stream beds were considered the most likely places to prospect for oil, (the natural excavation certainly saved much digging in the old fashioned clumsy way), and again from the 'nineties when plenty of water and good board were primary requisites for location with the explorers of the average company. To-day, thanks to pioneering work done by I. C. White in Pennsylvania which was followed later in the Canadian field by E. Coste, F. J. Carman and others, the localization of oil in "inverted" basins of rock, which take the form of domes, anticlines or monoclines, is well established in the average case, in which the strata bearing oil are also water-bearing and are of fairly uniform porosity. This is because oil floats on water and hence is forced to the top of the basin. In cases where the oil-bearing strata do not contain water, the oil tends to gravitate toward the synclines and basins, but as a strong driving force is lacking,

Structure Diagram of the Top of "Corniferous" Delaware limestone, showing the Bothwell Oil Domes. Structure contours are broken where information is insufficient. Contour intervals 10 feet, elevations are above sea level.

*By permission of the Geological Survey, Ottawa. Further information may be looked for in the 1917 Summary Report of the Geological Survey.

†Preliminary Report, Mineral Production of Canada, Mines Branch, Department of Mines, pp.20-21.

Structure Diagram of the Top of the Trenton Formation near Milton, Ont. The broken lines are approximate contours of lines passing through points of equal elevation at the top of the Trenton Formation.
 ↓ Contour intervals 10 feet; elevations are below sea level.

the accumulation is apt to be less pronounced than in the case of the normal accumulation in domes and anticlines.

Keeping these facts in mind, the well advised prospector collects all available data as to the elevation at different points of the formation to be prospected, and then chooses the highest point for his wells. Rarely does the first well prove or disprove the field. Well must follow well, the location in each case being made in the direction of higher structure suggested by previous wells, unless no water is found, in which case low structure is to be sought. The importance of keeping samples and accurate logs of wells in such work is evident. Except in very level country the elevations of the tops of wells should be determined, as only by knowing the surface elevations, can well logs be accurately compared and structure worked out.

In the light of recent oil discoveries in southwestern Ontario and in view of the fact that considerable areas of promising country have been lost sight of by being placed in the category of country already drilled, it seems probable that new oil pools will still be found in the Onondaga (Corniferous) limestone of southwestern Ontario. The Guelph formation is only partially explored, and it is possible that, by making use of the present knowledge of the structure of the Onondaga, new pools may be found in the Guelph beneath Onondaga (Corniferous) domes. Hopes are entertained that the Trenton formation, in spite of its apparent lack of water and varying porosity, may still be successfully developed.

Suggestions to Prospectors.

The attention of the prospector for oil is called to the following considerations. In the Milton area the highest structure probably lies about three-quarters of a mile north of the well in the Brandon brick yard which has produced some oil. The accompanying diagram showing the structure of the top of the Trenton formation as determined from the logs of some of the

wells already drilled, suggests that this is the case. The absence of salt water in the Trenton near Milton, however, would suggest drilling on lower structure, that is, away from the centre of the dome. Wells drilled to the south of the "oil well," however, struck no oil and although both producing gas wells are on lower structure the gas and oil of this region occur at different levels in the Trenton. It is probable that the rock porosity is variable, and hence the occurrence of oil is likely to be "pockety."

Other favorable locations for prospecting the Trenton formation are on the middle and southern parts of Manitoulin Island, away from Manitowaning bay and the north channel with its other tributary bays, which wash the Trenton outcrops and have thus allowed natural egress for oil and gas, and ingress for water. Excepting one dry well drilled by H. F. Slater 100 ft. into the Trenton at Providence bay, no drilling has been done south of Lakes Manitou, Mindemoya and Kagawong, and Bayfield sound. At Providence bay, the Trenton was struck at 900 ft. in depth. It is well known that considerable quantities of oil were found in the Trenton in wells drilled near Wekwemikong, Manitowaning and Gore Bay. At Manitowaning the Top of the Trenton was penetrated at a depth of about 440 ft.

The Bruce peninsula, north of Wiarton, also offers virgin ground for prospecting the Trenton. Numerous undulations in the rock structure are visible along the 20-mile coast line between Cabot Head and Cape Hurd, and down the eastern coast. Much of this region, however, is difficult of access and prospecting here can well await the results obtained in the Trenton elsewhere.

As indicated on the accompanying diagram, the structure in the Bothwell field suggests a favorable area for prospecting from one and one half to four miles east of Cashmere. The wells drilled to the north, south and east are not on line with the Bothwell domes and there is room for another dome in this unexplored area.

Exploration of Nickel-Copper Properties in Falconbridge Township, Sudbury District, Ontario*

By Hugh M. Roberts and Robert Davis Longyear.

During 1916 and 1917, the E. J. Longyear Co. of Minneapolis, Minn., carried out a campaign of exploration for nickel-copper ore in the Sudbury District of Ontario. The work was initiated by W. E. Smith, a resident of Sudbury, who called the attention of W. J. Mead, Chief Geologist of the E. J. Longyear Co., to the fact that explorable lands in the Sudbury District were still available. Five diamond drills were employed, and holes were drilled in the townships of Levaack, Trill, Denison, Blezard, Garson, Falconbridge and MacLennan.

As a result of this exploration, a large body of nickel and copper ore has been found in the western part of the Township of Falconbridge. This property lies in the eastern part of the Sudbury District, east of the Garson mine.

The geological direction of this work necessarily included a careful consideration of the nature and mode of occurrence of the Sudbury ore deposits and of the various existing ideas as to their manner of origin. Since exploratory work is very practical research in the theory of ore deposition, the writers propose in this paper to present the results of this investigation, and in particular to trace the influence of current theories of origin of the ores upon the conduct of the exploration.

The field geology is discussed by H. M. Roberts; the petrography and detailed study of the ore is the work of R. D. Longyear. We are indebted to C. K. Leith, W. J. Mead, W. H. Emmons and E. C. Harder for suggestions and criticisms.

The various places where drilling was to be undertaken were selected on the basis of A. P. Coleman's map and report. This was essentially the latest expression of the thought of Canadian geologists on the Sudbury District, embodying not only Coleman's own more recent work but the previous work of Barlow, Walker and others of the Canadian Geological Survey and the Ontario Bureau of Mines. Attention was given also to the work by Dickson, Knight and others, concerning the origin of the ore, whose views differed somewhat from those of earlier investigators.

It will not be necessary to enter upon a protracted description of the general geology of the district, as this has been discussed at length in recent geologic literature, but it may be well to outline a few important field relations.

Coleman's map shows a nickel-bearing intrusive, probably of Keweenawan age, which came in as a "laccolithic sheet" or sill. We wish to state our belief in the essential accuracy of this map. The laccolithic sheet is a body some 10,000 ft. thick and was intruded along an unconformable plane of contact between an older complex of Archean-Huronian rocks, and the younger flat-lying sediments mapped by Coleman as upper Huronian but described later by Collins as Animikie.

During the intrusion and cooling of this mass, the flat-lying sediments of the Animikie were displaced, and deformation of all the rocks in the area took place. The crust of rock covering the internal reservoirs, from which the intrusion came, ultimately settled, so that

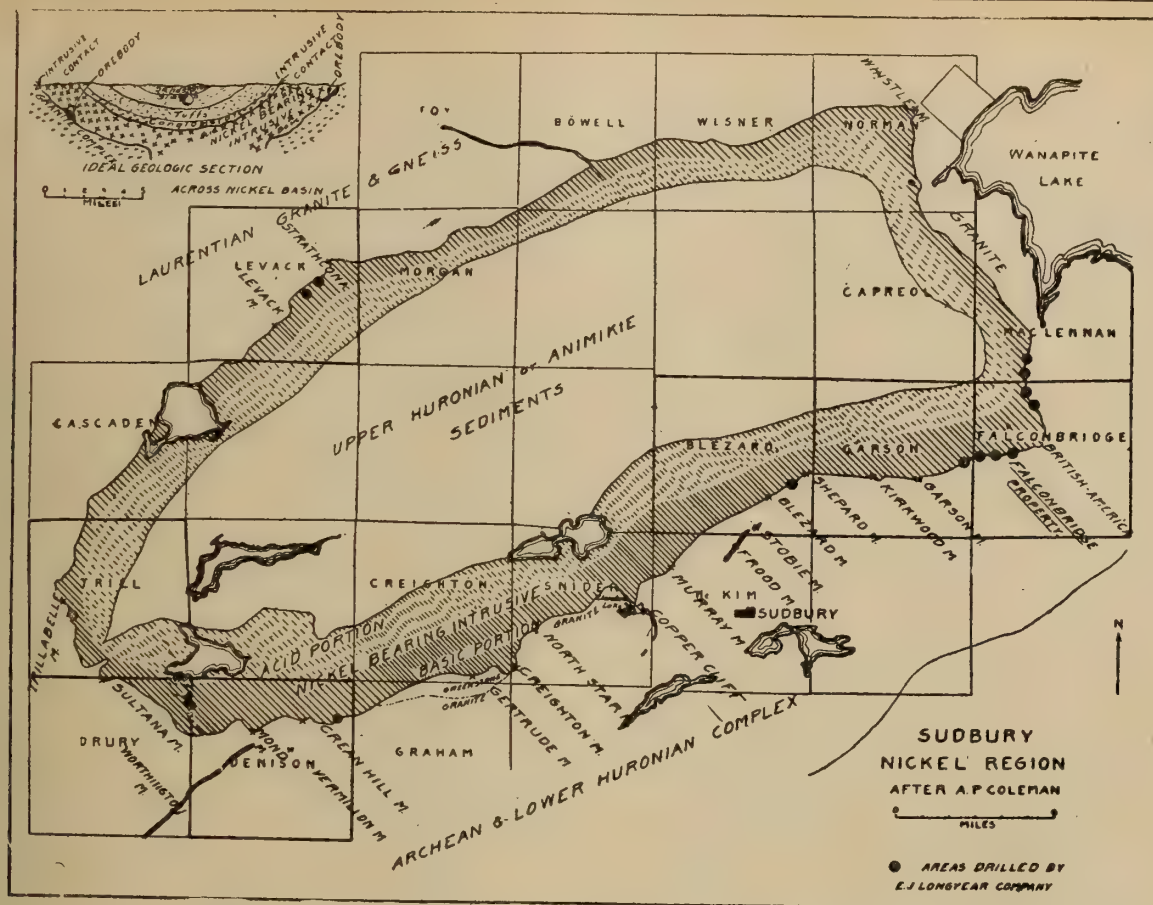

at present the central portion of the district is folded into a synclinal basin some 40 miles long and 15 miles wide. A great thickness of Animikie sediments has been removed, and also much of the nickel-bearing intrusive itself, bringing the lower portions to view at surface. The distribution of the intrusive is oval-shaped, and its outer edge constitutes the outer rim of the basin. The sediments in the interior of the basin have been faulted and continuations of these faulted zones, exterior to the basin, are represented by bodies of norite which were intruded into zones of weakness. These masses constitute forms described by Coleman as "offsets." Typical instances are found at Worthington and Copper Cliff.

Since the time when the magma was hardened into rock, many geologic periods have elapsed. During this interval, the region has been planed down by erosion. In much of the area, all of the rocks are stripped down to the older complex which is itself eroded. The region has since been glaciated.

The nickel-bearing intrusive is composed of two kinds of rock which grade into each other, micropegmatite, a phase of granite in the upper portion, and norite, a species of gabbro, toward the bottom. This gradation has been called in question—notably by Harker. At the very bottom of the intrusive, at its contact with the lower complex as now exposed by erosion, the norite and adjoining rocks contain the iron sulphide, pyrrhotite, with which is associated the nickel-bearing sulphide, pentlandite, and the copper-bearing sulphide, chalcopyrite. Commercial orebodies are found in places where the sulphides form a preponderant part of the rock. Orebodies of this type are described by Coleman as "marginal" deposits. The "offsets," previously mentioned, also carry important orebodies.

We believe, after examining many widely scattered cross-sections, that the intrusive sill is essentially one geologic body, differing in its mineral content from place to place. There are, however, later intrusions of diabase. An intrusion of granite also occurs within the norite near the Murray mine. Toward the interior of the basin, i.e., away from the lower contact of the intrusive, the norite changes its mineralogical characteristics and approaches granite in composition. This is true wherever the rock has been traced away from the contact in the Townships of Levaack, Howell and Wisner on the north, Trill on the west, and Garson and MacLennan on the east. The more acid rock which is found is similar in grain, and can always be recognized as a part of the same mass as the basic norite at the edge. In large outcrops of the intrusive, the effect of segregative tendencies in the molten mass may be witnessed; areas, 20 ft. square, or more, may be seen to be dominantly composed of pyroxenes. At a distance of 100 ft., segregations of rock comprised more largely of plagioclase and orthoclase feldspars may be seen. These occurrences are physically continuous and have a continuity of textures and grain. During the course of a single drill hole, for instance, one deep hole drilled in the Township of Levaack on the north side of the basin, the gradation in the mineralogical composition from basic to acid may be clearly recognized. These facts lead to the conclusion that the intrusive body is essentially one mass, solidifying from a molten magma as a unit. The constant and widely distributed relation between the basic and acid portions of this body leads to the same conclusion.

*Extracts from a paper to be presented at the New York meeting of the A.I.M.E.

Sudbury nickel region, showing areas drilled by E. J. Longyear Company.

We agree with Coleman that this mass is a sill, or laccolithic sheet, rather than a dike-like intrusion, for the reason that an inward dip from the contact toward the center has been found at every place where we have drilled—in Levack 45 deg., in Trill 30 deg., in Denison 45 deg., in Falconbridge 70 deg. to 90 deg., coinciding in this respect with the evidence at most of the mines. The instances of steep and southward dips of the contact on the south limb in Falconbridge Township and at Garson and Crean Hill mines might be accounted for, on the basis that the structurally weak sediments and greenstones of those localities yielded under the weight of the intrusive and rolled up before the advancing mass, whereas the more resistant granite, as at Creighton mine, withstood the thrust; hence the relatively flat dips wherever the footwall is composed of massive granite.

The Orebody in Western Falconbridge Township.

The orebody, here described, is located in Lots 10, 11 and 12 of the Fourth Concession of the Township of Falconbridge. It lies at the eastern end of the southern limb of the synclinal basin, occurring at the outer margin of the norite. The Garson mine of the Mond Nickel Co., $2\frac{1}{2}$ miles to the southwest, is the nearest productive orebody. East of the property, in Lot 8, Con. IV, is a prospect owned by the British-American Nickel Co., where a small tonnage of medium-grade ore has been developed.

The main orebody has a length of 7,500 ft. The exploration was done mainly by diamond drilling. A small exploration shaft was sunk in ore for the purpose of checking the results of the drilling.

A mantle of glacial drift, from 50 to 250 ft. thick covers most of the rock formation. Few rock outcrops occur near the norite contact. In the main, the drift has formed extensive sand plains broken in places

by kettles, locally known as pot holes. Cutting diagonally across the western part of the property in a north-easterly and southwesterly direction is a peculiar series of kettles, hills and ridges, which extend north-eastward to Wanapitei Lake.

The general inclination of the bed-rock surface is southeastward toward an old pre-glacial valley now indicated by swamp land, and small lakes. As shown by drilling, there is a rock escarpment along the north-west shore of Boucher Lake over which the glacial material has spilled, forming a steep bank.

The orebody occurs at the contact of the norite and footwall in a continuous band extending from the southwest corner of Lot 12, Con. IV, to the southeast corner of Lot 10, Con. IV, in the Township of Falconbridge. This is a total length of 7,500 ft., which is longer than any other known orebody in the district. This length has not been completely explored throughout, but it is a reasonable assumption that the ore is continuous over

Beyond the ends of this orebody are smaller outlying deposits, making the total length of the mineralized zone some 11,200 ft. The thickness varies from a minimum of 10 ft. to a maximum of about 120 ft. The greatest depth at which the orebody has been cut by a drill hole is 1,020 ft. below the surface of the ground. It probably extends to a much greater depth.

This orebody is a typical example of the so-called marginal deposit of the Sudbury district. In general, the ore is at the contact of the norite hanging-wall and the underlying quartzite or greenstone. In some cases, however, the ore is several feet away from the contact, and within the quartzite or greenstone. The ore generally dips steeply to the north. In two places, overhanging dips to the south have been observed. In some places the walls have a very irregular shape.

Map of nickel-copper deposit in Falconbridge Township, Sudbury District, Ontario.

The ores can be classified in three types: (1) norite partly impregnated with sulphides, (2) footwall (usually quartzite on this property) partly impregnated with sulphides, and (3) massive sulphides containing small particles of rock. The last type grades into the other two.

The sulphides in the norite usually take the form of blebs scattered uniformly throughout the rock. The sulphides in the footwall rocks may be blebs, but are more often in the form of irregular veinlets. Often the rock associated with the ore is so schistose that its original nature is uncertain.

In the massive ore, it is rare to find less than 5 to 10 per cent. of rock particles present. These particles may consist of quartz, norite, quartzite, greenstone, or an indeterminate schist. They may be rounded, sub-angular, or angular, and generally suggest replacement by the sulphides.

The sulphide minerals comprising the ore are, in order of abundance, pyrrhotite (Fe_7S_{12}), pentlandite (FeNiS_2), and chalcopyrite (CuFeS).

The proportions of minerals present are shown graphically in the accompanying figure. The first column represents the composition of a sample of typical mineralized or "spotted" norite. Each of the other

columns represents a composite sample of all ore in a drill hole between the foot and hanging walls. The relative amount of minerals present was calculated from analyses. It was assumed that all of the nickel occurs in the form of pentlandite. Cobalt, and arsenic were neglected as being too insignificant in amount to affect the results.

It will be seen that a very large proportion of the lode material is rock. It is customary in Sudbury mining practice to remove part of this rock by hand picking. The rest could be easily removed by flotation or some other mechanical process, but this is not desirable because a certain amount of siliceous gangue is necessary in order to act as a flux in the furnace for removing the iron. The rock gangue consists of quartz, or any of the country rocks or their altered equivalents. Calcite is rarely found.

Graphic representation of the relative amounts of sulphide rock gangue in several drill holes.

Curves showing percentage of nickel and copper in the ore from several drill holes.

The amount of chalcopyrite present seems to bear little relationship to the amount of rock, being as abundant in the rocky ores as in the richer ores. Pentlandite, on the other hand, increases as the amount of rock decreases, and bears a fairly constant ratio to the amount of pyrrhotite present. Analysis curves for copper, nickel, and combined copper and nickel, illustrate the same features. The "copper curve" has practically no slope from left to right (rocky to less rocky ores), while the "nickel curve," rises toward the right. A striking feature of this diagram is the complementary nature of the copper and nickel curves, maximums on the one curve being opposite minimums on the other, showing that where the copper is more abundant the nickel is less abundant.

The remarkable uniformity in the composition of the ore is noteworthy. The chalcopyrite is the most variable member; the pentlandite is somewhat more constant, while the pyrrhotite, except at the hanging wall, is invariably around 75 and 80 per cent.

Magnetite is present in the ore in small amounts, but its period of formation has not been determined. Pyrite has been observed in some of the core but the amount is negligible. It appears to be later than the other sulphides. In one place, a narrow band of galena was found cutting the mineralized norite. It is clearly a later introduction and not directly connected in origin with the orebody. Aside from these, no other sulphides have been detected, although a detailed study would undoubtedly disclose the presence of some of the rare nickel minerals such as polydymite, gersdorffite, etc.

Cross section of drill hole No. 308.

PERSONAL

Mr. T. J. Harwood, who was for some years manager of the La Rose silver mine at Cobalt, has been appointed to succeed Mr. S. A. Wooky as manager of the Schumacher gold mine in the Porcupine district, Ontario.

Mr. E. P. Mathewson left Toronto last week on an extended trip through the Western States and British Columbia. He expects to return to Toronto in about two months.

Mr. J. B. Tyrrell, who has been for some weeks in England, has returned to Toronto.

The following have been nominated, and will be elected by acclamation, as councillors of the Canadian Mining Institute for 1918-1919: Alfred Stansfield, N. R. Fisher, E. P. Mathewson, R. E. Hore, S. B. Wright, Jules Charbonnier, W. P. Williams, R. H. Stewart, Geo. Wilkinson and W. R. Wilson.

Prof. H. E. T. Haultain has been elected a vice-president of the Engineering Institute of Canada (Canadian Society of Civil Engineers). Mr. H. H. Vaughan is president.

Mr. R. Randolph Bruce, of East Kootenay, B.C., has gone to Honolulu, Hawaiian Islands, on a vacation trip.

Mr. Geo. H. Aylard, general manager for the Standard Silver-Lead Mining Co., operating near Silverton, Slocan, B.C., recently left Victoria for Southern California, to spend some weeks in that country.

Mr. Gomer P. Jones, general superintendent for the Hedley Gold Mining Co., has returned to Hedley, Similkameen, convalescent after having been operated on in a hospital in Vancouver, B.C.

MR. HANNA GOES TO PERU.

Toronto, Feb. 4.—Hon. W. J. Hanna, who resigned the office of Food Controller recently, will leave for Peru this week for the purpose of adjusting some matters between the International Petroleum Corporation and the Peruvian Government. Mr. Hanna is a director of the International Petroleum Corporation, which produces a considerable amount of crude oil in Peru. A part of the output is conveyed in tank steamers to the new refinery of the Imperial Oil Company at Vancouver, and a considerable quantity is used in the nitrate plants in Chile. These industries provide the raw material for the great powder manufacturers of the United States. It was generally understood in official circles that when Mr. Hanna quit the post of Food Controller he undertook to stimulate the production of fuel oil for the Admiralty, and of gasoline for the air service of both the British and United States War Departments. Mr. Hanna will be absent about two months.

The decision of the Nipissing mining company to discard the flotation process is an indication that very good results can be obtained by other means. The episode will help to show that unreasonable demands of patent owners can be met in many ways.

Up to date the charge that the Minerals' Separation North American Corporation is controlled by Germans has not been proven. So far as we know the charge is false.

Coal Production in Nova Scotia

By F. W. Gray.

Underneath is shown a tabulated statement of the production of the individual coal companies in Nova Scotia during the calendar year 1917, giving, in addition, the output of the companies during the war period and during the year preceding the commencement of hostilities:

Coal Outputs in Nova Scotia: (Ton of 2,240 lbs.)

	1913.	1914.	1915.	1916.	1917.
Dominion Coal Company—					
Cape Breton Collieries	4,739,139	4,287,717	4,608,979	4,091,790	3,551,800
Springhill Collieries	381,434	417,406	400,791	351,315	364,700
Nova Scotia Steel and Coal Co.	813,877	752,153	611,923	605,650	582,000
Acadia Coal Company	539,121	394,397	340,975	392,065	390,000
Intercolonial Coal Mining Company	189,550	213,289	177,977	143,748	180,000
Inverness Coal and Railway Company	293,847	264,842	245,749	265,427	195,000
Maritime Coal and Railway Company	155,051	141,830	175,482	197,101	203,000
Minudie Coal Company	65,562	65,147	79,760	54,191	30,000
Bras D'Or Coal Company	65,844	53,420	56,941	44,357	44,000
Greenwood Coal Company	2,332	55,000
Milford Mining Company	8,500	18,000
Stratheona Coal Company	2,400	14,000
Sterling Coal Company	8,500
Fenwick Coal Company	3,500
Barnes Mine	3,200	5,000
Sydney Coal Company	5,420	7,458	5,989	6,000	6,000
Fundy Mining Company	735	5,500
Cape Breton Coal, Iron and Railway Co. ..	8,425	48,277	2,500
Royal Coal Company	700	2,150
Atlantic Grindstone Company	2,718	709
Other small producers	3,497	2,693	3,348	4,000
Percentage of production in:	7,263,485	6,650,031	6,709,951	6,171,424	5,660,000
Cape Breton Island	81½%	81½%	82½%	81¼%	78%
Mainland Collieries	18½%	18½%	17½%	18¾%	22%
Reduction from the basis of 1913.		8½%	7½%	15%	22¾%

The most noticeable feature of 1917 production is the increase in the number of new enterprises. It is probable that during 1918 there will be many further additions to the list of producers, but it is expected that these smaller companies will increase their production, perhaps to an aggregate of 200,000 tons. In 1917 the new enterprises added about 100,000 tons of additional production. Nevertheless, it may be anticipated that the total output of the Province during 1918 will fall below that of 1917, and will, barring accidents or stoppages of work, be in the vicinity of 5,300,000 tons.

The explosion at the Allan Shaft of the Acadia Coal Company will cause a restriction of output, to what extent it is not yet possible to say. The chief restriction will in all probability not arise from the damage to the mine workings caused by the explosion, but from the loss of the labor of the 88 men who were killed by the explosion. The combined loss of life in the Waterford explosion of last July, and in the most recent disaster, is 153 men. The work of 153 men should produce 140,000 tons of coal in 12 months, and in the present state of the labor market, the loss of life referred to will bring about a reduction in coal production to that extent.

In making this observation, which admittedly is made from a purely materialistic standpoint, the

writer does not desire for a moment to infer that in any person's mind it takes precedence over the considerations of sorrow and suffering that are involved in these dreadful accompaniments of coal production. No person who lives and works among a mining population would be guilty of a suggestion of this nature,

but in view of the enormous value of coal to-day, and in view of the importance of coal as a decisive factor in a moral struggle, as a most potent weapon in what we believe to be a struggle of right ideals against the forces of oppression and error, not the least of the harm wrought by these explosions is the effect on the production of coal. The men who died in these two explosions lost their lives in the Empire's cause as truly as though they had died by German arms, and the loss of their productive labor is equivalent to the loss of fighting men in battle.

The origin of the explosion is as yet only a matter of conjecture. Full exploration of the mine and complete recovery of the bodies has been hampered by heavy falls of coal and stone, and by the rising of water in the mine owing to the pumps being stopped by the effects of the explosion.

It is to be hoped that the investigation which may be expected to follow will not be marked by the conflict between the scope of a coroner's inquisition and the work of a technical departmental commission which was observable in the case of the Waterford explosion, and it is further to be desired that any proceedings in the nature of a criminal prosecution shall only be undertaken by the direction of a commission or other competent body of eminent technical men.

Ontario's Mineral Wealth

The rapid growth of Ontario's Mineral industry may be gleaned from the following figures. The drop in 1914 is attributable to the outbreak of the war in that year.

Year.	Value.	Year.	Value.
1893.....	\$6,120,753	1914.....	\$46,295,959
1903.....	12,870,593	1915.....	54,245,679
1913.....	53,232,311	1916.....	65,303,822

ONTARIO IS CANADA'S PREMIER MINERAL PROVINCE, the 1916 production being 45 per cent. of the total output from Canada.

NICKEL: Sudbury produces 80 per cent. of the nickel of the world, and in 1916 the nickel-copper matte output contained 41,299 tons of nickel valued at \$20,649,279, and 22,430 tons of copper worth \$8,332,153.

SILVER: Chiefly from Cobalt and outlying camps, 20,007,367 ounces of silver, worth \$12,703,591, were produced in 1916. The total silver production from the Cobalt camp up to the end of 1916 was 255,322,297 ounces, valued at \$135,829,548.

GOLD: For 1916 the gold output was 497,833 ounces, valued at \$10,339,259. From the Porcupine camp the total production to the end of 1916 was \$28,200,322. Ore reserves of the producing mines at Porcupine are estimated at \$50,000,000. The Kirkland Lake camp comes next in importance.

DIVIDENDS PAID TO JUNE 30TH, 1917* EXCEEDED \$70,000,000 FROM THE COBALT SILVER CAMP, AND \$10,000,000 FROM THE PORCUPINE GOLD CAMP.

The total valuation of the chief metals produced in Ontario up to the end of 1916 is as follows:

Silver	\$151,428,500	Gold	\$33,663,648
Nickel	89,128,164	Copper	33,452,628
Pig Iron	76,544,482	Cobalt	3,180,990

A Recent Discovery in Northern Ontario

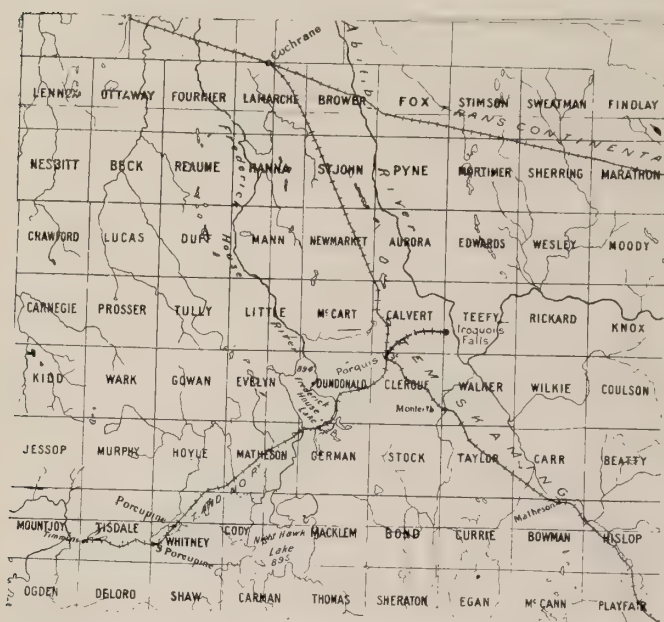

By Percy E. Hopkins

Ontario is at present Canada's chief gold producer, the output for 1916, largely from Porcupine, amounting to \$10,330,260. The success at Porcupine since 1910 has led to vigorous prospecting, resulting in other gold fields being opened from time to time, viz.: Swastika, Kirkland lake, Munro, Long lake, Kowkash, Powell, Rickard, Lightning river, and other localities. Rickard

The country is undulating, and superficial deposits consist of stratified clay through which occasional rocks rise as high as 100 ft. above the stream valleys. Much of the forest in this particular area was destroyed by the big fire in 1916.

Only a cursory examination has been made by explorers of the geology along the canoe routes. The rocks are pre-Cambrian, consisting of Keewatin pillow-lava schist (meta basalt) with subordinate areas of altered diabase and cherty iron formation, all of which have been intruded by narrow dikes of hornblende-granite porphyry and quartz-diabase, probably of Algonian and Keweenawan age respectively.

Gold was first found near the centre of the claim in a 3-inch quartz vein striking east and west in a rusty weathered carbonate schist. The main deposit, however, is on the north part of the claim and strikes east and west for at least 600 ft. The vein averages about six feet in width and has a vertical dip. Quartz,

Sketch map showing position of Rickard township with reference to Iroquois Falls, Timmins and Cochrane

is one of Ontario's most recent discoveries. The township was named in 1902 after W. Rickard then M.P.P. for West Durham.

Rickard township is situated 100 miles north of Cobalt, 40 miles northeast of Porcupine, and 10 miles west of Abitibi lake. It can be reached by navigable water from the towns of Matheson or Iroquois Falls on the Temiskaming and Northern Ontario railway, or from Low Bush station on the Transcontinental railway.

In July, 1917, gold was found on the southwest quarter of the south half of lot 7, concession IV. of the township. The first discovery was made by a Finn named John Raty at a point 200 yards from a telephone line which runs from Iroquois falls to Couchiching falls on the Abitibi river and has been travelled for some years by the officials of the Abitibi Pulp and Power Company. Shortly after the discovery, representatives of two mining companies sampled the vein; but obtained low values. Later, in sinking, the prospector found a rich gold showing at a depth of five feet, which resulted in the Mining Corporation of Canada securing a working option. At present, January, 1918, the shaft is over 50 ft. in depth and much spectacular ore has been encountered.

Rickard township, showing location of the Raty gold discovery and topographical features. The stippled area will be flooded

the chief gangue mineral, has a milky appearance. Calcite occurs as a replacement mineral in the wall rock rather than in the vein itself. Tale and sericite are frequently met with, while feldspar is not so prominent. Among the sulphides, pyrite is the most abundant, there being also small quantities of copper pyrites, galena, and molybdenite. Molybdenic oxide and native copper are secondary minerals near the surface. The gold,

which is extremely coarse in places and varies in color from light to dark yellow, occurs in crushed portions of the quartz with tellurides and other minerals, the gold usually crystallizing out after the tellurides. In the samples examined two tellurides have been identified, viz.: tetradymite (bismuth telluride) and altaite (lead telluride). A silver telluride may be present, as

considerable silver was found on analysis. The magmatic waters connected with the porphyry intrusions may have had much to do with the ore deposition.

The Mining Corporation of Canada is meeting with encouraging results so far. A small steam plant is in operation and diamond-drilling will be done. One may expect to hear more of this property in the near future.

Gold from a recently discovered deposit in Rickard township, Northern Ontario

This specimen is from the Raty claim, which is being worked under option by the Mining Corporation of Canada. The Raty claim is near the centre of Rickard township, about 10 miles west of Abitibi lake.

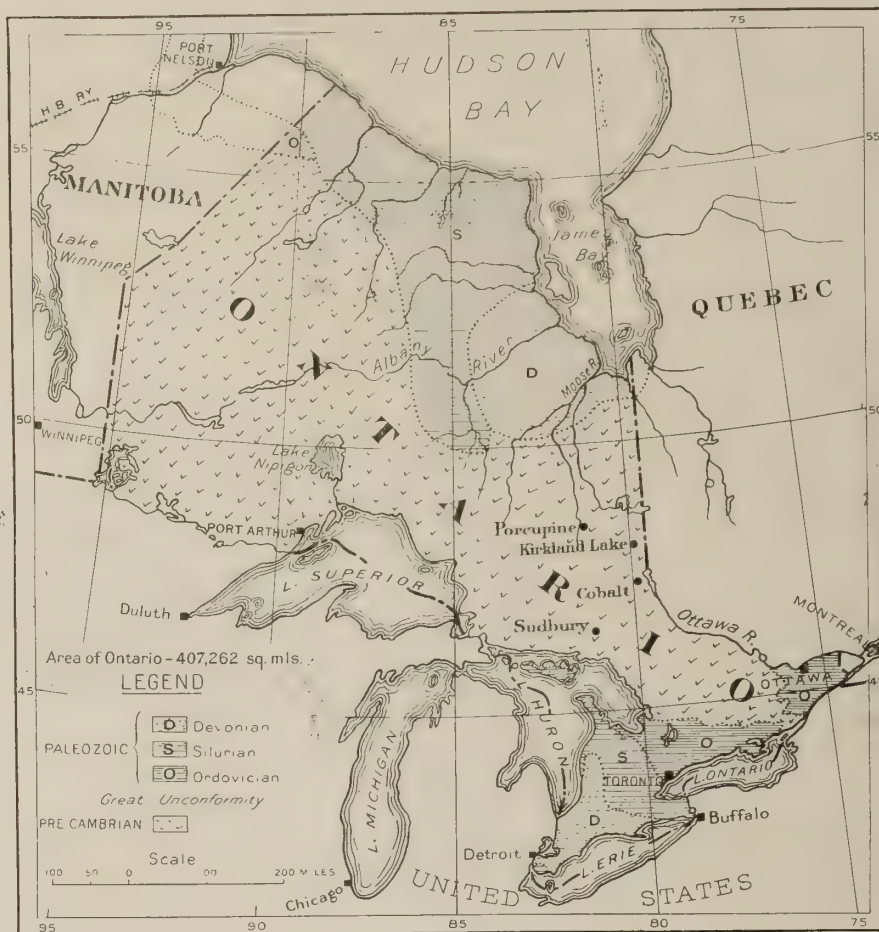

The illustration shows a smooth polished surface and the rough natural fracture.

PROVINCE OF ONTARIO

DEPARTMENT OF FORESTS & MINES
OF LANDS
BUREAU OF MINES

GEOLOGICAL SKETCH MAP OF ONTARIO

The area of Ontario is 407,262 square miles, 70 per cent. being pre-Cambrian, which is pre-eminently the metal-bearing formation of the Province.

Ontario's mineral resources cover practically the entire list of metallics and non-metallics with the exception of tin and coal.

The producing camps are readily accessible by railway, the climate is invigorating and healthful, water power is near at hand, and other conditions are favorable for mining.

PARLIAMENT BUILDINGS
TORONTO, CAN.

There should be no suppression of pertinent facts. The newspapers have published a statement on the authority of leading officials of the Acadia Coal Company that the proximate cause of the disaster was a "bad shot." If this is the case, the full facts should be disclosed, for it is a significant fact that every coal mine explosion of any magnitude that has occurred in Nova Scotia had for its proximate cause a "bad shot," either a "flaming shot," a "blown-out shot," a "windy shot" or some one of the various forms under which blasting shots are classified which, instead of expending their explosive energy on the coal, expend their force in the mine atmosphere.

Obviously, the firing of blasting shots should be confined to cases where no other method of coal extraction is feasible, or to hours when large bodies of men are not present in the mine. In some cases, it is open to question whether the larger and cheaper extraction of coal which has been rendered possible by the use of explosives has not in the long run been nullified by the loss of life and property, and of production, by disasters directly attributable to their use.

Whether the total abolition of the use of explosives in coal mines is possible or not is a matter that is conditioned by economic conditions that affect alike the miner, the operator and the consumer, because such a prohibition would increase the cost of coal enormously and would, for a long time, greatly reduce the rate of coal production, but it may be conservatively stated that all steps which tend to the restriction in the quantity of explosives used in coal extraction constitute progress in the right direction, and in the direction which will be followed in the future evolution of mining practice.

NEW YORK MEETING A.I.M.E.

New York.—War work for the mining engineer and a concentration of his efforts to meet the mineral needs of the country, will be the subjects to dominate the 116th meeting of the American Institute of Mining Engineers. The meeting opens in New York on February 18th, and continues for four days. During the sessions prominent men who have been in the center of war activities in this country and in Europe will address the gathering, and mining engineers from every part of the country will study means of solving the war mineral difficulties.

About 50 technical subjects will be presented at the Institute meeting. Some of them deal with such timely topics as the economy of electricity over steam for power purposes in and about the mines, the erosion of guns, extraction of gasoline from natural gas, the Chilean nitrate industry and the employment manager and labor turnover reduction.

An elaborate entertainment program has been arranged both for the Institute members and the ladies accompanying them. On Monday evening, February 18th a war smoker will be held. On Tuesday evening a novel entertainment, and on Wednesday a "Hoover dinner" at Hotel Biltmore. Herbert Hoover is one of the few honorary members of the Institute.

On Thursday, the last day of the convention, an all-day excursion will be made to Princeton, N.J., to visit the government aviation field and University campus.

Some of the features of the entertainment of ladies are a visit to the art galleries of Senator W. A. Clark and of Henry C. Frick, a matinee, a tea and several luncheons at the Engineering Societies' Building.

Metals and Metallurgical Research*

By S. F. Kirkpatrick.

The metals have played an important part in the development of civilization from the earliest historic times, down to the present. They have been a factor in determining the fortunes of war. The bronze armed warrior drove out the man of the stone axe and the iron equipped soldier in his turn subdued the bronze armed races. History tends to show that the claim "the strength of a nation can be judged by the success with which it practises the metallurgical arts" has a true foundation.

This is not, however, generally appreciated, and the Japanese in his worship of his sword and the sword-maker is an exception rather than the rule. The iron worker has held an honorable position as typifying honest toil rather than as holding a position in the fore-front of the civilization of his country.

To-day as never before the rulers of the nations recognize the part that the metals play in determining the fate of nations.

Great Britain was the greatest coal, iron, and general metal manufacturer of the 19th century and as such was secure in her premier position among the nations. Germany, however, early recognized the need of iron and steel for the furtherance of her scheme of conquest and as early as 1870 exacted from France as penalty of defeat what was then supposed to be practically all the iron fields of the Minette district of Alsace-Lorraine, the most important iron ore reserve in Europe.

With this resource and her own coal fields around Essen, Germany then proceeded to foster her steel industry, increasing her steel production in the quarter of a century immediately preceding the war almost twelve times from 1,600,000 metric tons in 1888 to 19,300,000 metric tons in 1913. During this time Great Britain's output increased only two and one-half times from 3,000,000 metric tons in 1888 to 7,500,000 metric tons in 1913. That is, at the beginning of the quarter century preceding the war, Great Britain produced twice as much steel as Germany, while at the end of that period Germany's production was two and one-half times that of Great Britain. Fortunately the production of the United States increased almost thirteen times during this period from 2,400,000 metric tons to 31,000,000 metric tons.

How Germany Prepared for War.

It is interesting to note that preparation for hostilities was probably one of the chief causes of the activity of the German steel industry during the years immediately preceding the war. For instance, part of the energy of the iron manufacturer was directed to the building of the strategic railways on the East and West fronts that in many cases were required for no other purpose than that of the rapid mobilization of troops. The German steel industry also led in the production of war munitions, such as the manufacture of cannon. The Belgian forts were equipped with Krupp guns that could be blown to pieces by larger guns manufactured in the same works.

It might also be said that Germany's success in the manufacture of steel was an important factor in encouraging her to defy the other powers of Europe.

When war started the main strategy of Germany was to cripple France in her coal and iron resources and by

*From an article published in Queen's Quarterly.

the advance through Belgium into the northern part of France Germany came into temporary possession of almost all the iron and coal of continental Europe. This would have been disastrous to French hopes if it had not been that Great Britain was ready, pressed though she was, to come to her assistance. We are only beginning to understand now how serious the situation was in the fall of 1914.

Germany was not so well situated in regard to some of the non-ferrous metals especially copper, as she was manufacturing only three per cent. of the world's copper before the war, while consuming thirty per cent. But even in this industry we can see her appreciation of the metals, as some of the copper mines were said to be operating at a loss before the war and were being kept open only by government aid. This was then said to be a splendid example of the paternalty of the German government that wished to keep this industry on its feet so as not to have to throw so many miners and metallurgists out of employment. Now we are able to appreciate that there may have been other reasons for Germany's encouragement of this industry.

War Has Emphasized Importance of Metals

Since the war started, needless to say, all those closely in touch with military operations recognize the value of the metals as they are required for all parts of the huge army and navy machines. Never before has the need of replacing manual labor with machinery been so keenly felt in the industries.

Even an industry such as agriculture, often rather antagonistic to the industrial life of the country, is becoming more than ever dependent upon the metals and their successful manufacture into farm equipment. As an example, when Great Britain was first confronted by the intensive submarine war the authorities recognized the need of developing her neglected agricultural resources, but they had no men to throw on the land. It was to the machine manufacturer that they appealed and thousands of farm tractors were rushed over from the workshops of America to take the place of the army of men that would otherwise have been required.

The great need of metals is to-day emphasized by the recognized necessity of steel for ship building. The iron manufacturing resources of the United States, great though they are and stimulated by high prices, are being taxed to the utmost. Government orders take first place and the civilian consumer has often to wait. The tendency is to curtail all uses of metal that are not of immediate national importance.

This growing importance of the metals is not only a war effect, for the annual production of iron and steel in the United States has regularly doubled every ten years for the last century, and the end is not yet. Only part of this increased production is due to the increase of the population of that country as the production of iron in the world has increased about fifty per cent. for each decade for the last century.

This increase is followed by the other metals, copper having increased about six-fold in forty years and the latest addition to the family of common metals, namely, aluminum, showed a tenfold increase in the first decade of its use and a tenfold increase during the second decade. It is too early to say what the increase will be during the third, but it will be a very large one.

Increased Use of Alloys.

Not only is there a steady increase in the production and consumption of metals but in the variety of alloys or mixtures of metals employed in the industries.

Every part of the modern complicated machines of industries, of railroad equipment, army equipment, naval force or flying machines, is studied in order to adapt to each the metal or alloy best fitted to give the greatest service.

This entails a knowledge of metallurgy undreamed of fifty years ago. Now we use iron alloyed with various proportions of one or several of the following elements: Carbon, silicon, manganese, copper, chromium, tungsten, molybdenum, nickel, cobalt, uranium, titanium, vanadium, zirconium, aluminum.

Many of these elements are so important in conferring valuable properties on steel that it has been suggested for each in its turn that a nation cut off from its use could not wage a modern war. This claim has been made in technical and popular literature for nickel and it is only a short time ago that the Ontario people and press were much exercised over the chance that some of the nickel of Canada was finding its way to Germany. Chromium is as essential as nickel in manufacturing armour plates and projectiles.

A strong claim has been made for the vital importance of tungsten. This metal is used in the production of high speed steels and it has been claimed that if this metal could not be obtained the ability of the workshop to produce shells and other war materials would be reduced to a fraction of their present capacity due to the fact that the ordinary carbon steel cuts so slowly. Manganese is another metal almost essential to the manufacture of steel, and America is feeling a shortage of this metal at the present time.

Importance of Metallurgical Research.

The metallurgy of to-day is becoming a well-developed science, while only fifty years ago it could be considered an art. The properties of metals are determined by the chemist and metallographist with the assistance of physical testing laboratories rather than, as formerly, by the artisan. It is therefore to the trained chemist and metallurgist that we look for development in the production and use of the metals. Research of an industrial and scientific nature is becoming a more important factor.

This work has a bearing on the problem of the shortage of labor. In connection with the production of the metals themselves the tendency is to develop processes for the treatment of ores that will require few men to operate them. We now have large mills crushing and concentrating ten to twenty thousand tons of ore per day, operated by a mere handful of men.

Research also tends towards the elimination of waste. Twenty years ago most of the concentrating and metallurgical plants would have thought they were doing good work if they recovered 70 per cent. of the metals in an ore, now 90 and 95 per cent. would be expected and obtained. There has also been a development in the method of treating refractory ores containing a mixture of several metals. A few years ago the smelter would have been content to treat the ore for the recovery of one or two of the metals and to let the others go to waste. The modern metallurgist is not satisfied unless he is extracting and marketing all the metals in the ores. Much has been done in this line, but there is still much to do, though each year as it passes sees important gains made.

The war has only intensified the need for these economies and emphasized the need for all the metals we can produce. It also shows the necessity of a country adapting itself to its own resources. This is

forcing a greater development in the science and industry of metallurgy than that experienced before the war.

On account of the closing of certain trade routes and the shortage of shipping facilities, America is thrown largely on her own resources. No longer can she depend on the sulphur from the pyrites of Spain or on the manganese from Russia and India, nor altogether on the chromium of New Caledonia or Africa, or the tungsten of India. The metallurgists of America can and are replacing these ores by intensive search into the mineral resources of the country and by developing deposits formerly considered unworkable. New metals are also being developed and new alloys manufactured.

Canadian Resources Should Be Developed.

What is Canada's part in this work? We who are sending 500,000 men to France are one of the principal metal producing nations of the world and have a responsibility in regard to this development in metallurgy and the adapting of our metal resources to war requirements.

It is only within the last fifteen or twenty years that Canada has been actively developing her mineral sources and manufacturing metals, but she already takes an important place in the production of iron and steel, copper, lead, aluminum, and is the fourth country in order of gold production. This country also produces one-eighth of the world's silver, one-quarter of all the arsenic consumed on this continent, and has the leading place in the production of asbestos, nickel, and cobalt. Only within the last two years under stress of war conditions metallurgical researchers have added metallic zinc and metallic magnesium to the list of her products.

The main object at the present time must be the intensive production of those metals of prime importance for war purposes, but almost all of the metals mentioned come under this head. Steel, formerly so largely used for structural purposes, is in greater demand for war munitions and ships, copper for brasses, lead for munitions rather than paint, aluminum for army equipment and flying machines, and silver, generally considered as a luxury, is in greater demand than ever for the manufacture of currency. Canada supplies the arsenic for the insecticide requirements of over 25,000,000 people. Nickel is primarily a war metal, and cobalt, although used before the war practically altogether in the ceramic industry, is now largely consumed as an ingredient of high speed steel and in the manufacture of the new tool metal, stellite, used largely for the turning of shells.

The mining and metal production of Canada will be an important factor in post-war conditions, as an abundance of metals will be required during the building up stage, and with the influx of labor Canada should be able to supply these from her developed and undeveloped resources.

One of the few Nova Scotia coal operators to consistently increase output during the war is the Maritime Coal & Railway Co. This company leased two new areas from the Minudie company and increased its output to 203,887 tons in 1917. As Mr. Gray shows on another page, Nova Scotia has been unable to maintain its output when it is most needed. The coal is available, but the mines are short of men and ships are scarce.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.

Nipissing.

An average production of nearly eleven thousand dollars per day was the record established by the Nipissing Mining Company for the month of December, during which month the company mined ore of an estimated net value of \$340,793, and shipped products from Nipissing and customs ore of a net value of \$376,433. Several new crosscuts and drifts were started during the month, but no new veins were encountered. The underground work during the month was very similar to that of November. Shaft No. 63, which has been idle for two years, is being pumped out and will be in operation again in the near future. A diamond drill will be started shortly drilling in a possible favorable area of the diabase on claim R. L. 407. In his report to the directors, Mr. Hugh Park stated that the high and low grade mills were both busy with the annual clean-up. During the month the high-grade mill treated 71 tons and shipped 401,869 fine ounces of bullion, the low grade mill treated 6,281 tons. The year recently closed by Cobalt's premier mine was the best in its history, the earnings of the company amounting to \$3,358,973, the December output being nearly double that of the first month of the past year. The future outlook of the company with the prevailing high price of silver is indeed very bright.

Kerr Lake.

The production of silver at the Kerr Lake mine is being maintained at a rate of nearly seven thousand ounces per day, or about two and a half million ounces per annum. This figures out at close to \$6,000 per day with a net profit of about \$4,000 every twenty-four hours. With a substantial margin of profit, the Kerr Lake is maintaining its position as the third largest silver producer in the Dominion of Canada. Ore reserves of upwards of three million ounces were recently estimated officially, and the silver deposits are steadily being proven to extend beyond previously known limits. The company is becoming increasingly active in the prospective field, and at the present time are meeting with favorable results in the development of the Mondeau claims in McElroy township of the Boston Creek district, which they have had under option for some time. A system plant has been installed on these claims and development work is being carried on systematically.

Mining Corporation.

The Mining Corporation of Canada, which is the greatest silver producing company in the British Empire, has been adding to its Canadian properties located in Northern Ontario at a rapid rate, and at the present time owns and operates: the Cobalt Lake mine, the Cobalt Townsite Mine, the City of Cobalt mine, the Townsite Extension mine, the Little Nipissing mine. These properties comprise a total of 186 acres and are located in the Cobalt Camp. This powerful corporation at the same time has under option: the Waldman mine (silver) 87 acres, the Alexander (silver) 20 acres. Both of which are located in the Cobalt Camp: the Hylands property (silver) 260 acres, located in the Gowganda Mining District, and a gold property comprising 120 acres in the township of Rickard. According to unofficial reports, the production of silver for the company from its Cobalt properties for 1917 will total over 5,000,000 ounces. During the years 1915-1916 the com-

pany produced approximately 4,500,000 ounces. Owing to new processes of treatment installed, the company can now treat with a profit the huge amount of tailings which have been accumulating in the bed of Cobalt Lake, from which it is estimated that considerably over one million ounces of silver will be obtained. The Mining Corporation is entirely a self-contained plant which reduces its own ore to the form of bullion for shipment.

Temiskaming.

The Temiskaming mining company, which is the centre of a good deal of controversy at the present time, may be said to enjoy a fairly strong financial position. According to a statement issued on November 1st, the Temiskaming had \$441,862 in cash on hand, together with 298,554 ounces of silver, either in storage, due from the smelter, or bagged at the mine. The value of these quick assets with silver at 90 cents per ounce would be about \$710,000. The ore reserves still in the mine should yield a probable net profit of \$300,000, so it may be said that there is not far under one million dollars back of the Temiskaming mine. Since this report was made, one dividend of \$75,000 as been paid. The company has under option and is developing the Hoheuner claim No. L 5433, in the Kirkland Lake gold area. In addition to this the company owns the North Dome mine in Porcupine. The plant from the latter property has been moved to the Hoheuner claim at Kirkland Lake for the purpose of carrying on an extensive exploration campaign there.

Ore Shipments in 1917.

The total amount of ore shipped from the Cobalt Camp during the year 1917 was approximately 21,000 tons. This compares with 15,050 tons the preceding year and about 16,000 in 1915, and about 18,220 tons in 1914. This marked increase in tonnage is more remarkable when it is remembered that at the present time the various mills in the camp are treating greater tonnages of their ore at home than ever before in their history, and shipping the product in the form of bullion.

Trethewey.

The shareholders of the Trethewey mining company have decided to acquire a controlling interest in the Castle mining company, which owns claims adjacent to the Miller Lake-O'Brien mine in the Gowganda district, and which are said to include a portion of the contact along which the latter company are mining high grade silver ore. J. P. Bickell, of the McIntyre, and H. D. Symmes, of the Boston Creek mine, are identified with the Castle mining company.

Provincial.

New development work is to be done between now and spring in virgin territory contiguous to the older workings in the Provincial mine at Cobalt, according to recent reports. The mill at the property is said to be working twenty-four hours a day and giving splendid satisfaction. The management is now considering the installation of oil flotation equipment. It is considered probable that this will result in better extraction.

Coniagas.

According to the recent annual statement of the Coniagas mining company, ore reserves at the property were estimated to total 5,347,090 ounces of silver. This estimate included the sand and slime tailings which are estimated to contain 859,500 ounces. With the distribution of a two and one-half per cent. divi-

dend February 3rd, the company has distributed to its shareholders a total of \$8,840,000 in dividends.

Nipissing Discards Flotation Process.

The Callow flotation plant, at the Nipissing mine, is being discarded and preference is being given to the cyanide process. One factor which has much to do with the decision of the Nipissing is that great difficulty is experienced in treating and marketing the flotation product. Another feature is the possible litigation with the Minerals Separation Company, who claim control of the flotation patents. By the use of Wilfley tables, followed by cyanide, the Nipissing company find it possible to turn out a much more satisfactory concentrate, which is easily refined and made ready for the market in the form of high grade bullion.

Crown Reserve.

The Crown Reserve mining company, during the year 1917, made a net profit of nearly \$80,000 more than during the preceding year. The mine profit for the year 1917 amounted to \$82,572, as compared with \$2,973 during 1916. With a balance of \$770,533 carried forward from 1916, the profit and loss account shows a total of \$980,079, and after paying head office superintendence, taxes, depreciation, prospecting and exploration totalling \$148,314, the surplus was \$781,765, as against a surplus last year of \$770,533. The above statement of earnings at the mine came as a considerable surprise to the shareholders of the company, in view of the reports given out at the previous annual meeting. According to a recent report from New York, the Crown Reserve is said to be interested in a placer property near Idaho Springs, Colo., and is said to have obtained satisfactory results from diamond drilling operations. The company has also secured an option on the Welsh claims in the Gowganda district and has installed a three-drill compressor plant with two 40 H.P. boilers and other necessary equipment to thoroughly explore the property on which a number of promising veins were in evidence on the surface.

Adanac.

The vein along which the Adanac is drifting at the 310-foot level continues strong, and the geological conditions are considered favorable, being identical with those predicted in the recent geological survey of the property. Towards the north end of the Adanac the diabase dips sharply, and on the Prince claim to the north of the Adanac the diabase is within 250 feet of the surface. In the basin between the present workings of the Adanac and the Prince claim is the zone wherein leading geologists believe ore deposition is likely to occur, and it is this section the Adanac propose to develop.

Keeley.

The Keeley property, in South Lorrain, although it is considered one of the best silver prospects in the north country, is idle, owing to the fact that it is under option to an English company which is not bound to exercise its option until one year after the war. This arrangement, perhaps more than anything else, is serving to retard development in the South Lorrain district. In the early days of its operation the low price of silver, and financial mishaps, served to curtail operations. There are other properties in the immediate vicinity of the Keeley with considerable merit and there are quite a number of prominent mining men who still pin their faith in the future of South Lorrain and believe that prosperous days for that district will again be realized.

Pittsburg-Lorrain.

Mining operations at the Pittsburg-Lorrain (formerly the Currie property) are being attended with satisfactory results. During the past few weeks the mill at the Wettlaufer property which is under lease to the former company, has been kept going on ore from the Wettlaufer. However, a change has now been made and ore from the Currie is being treated. It was at one time thought that milling operations would have to be suspended during the winter, but such has not proven the case. At the present time, crosscutting at the third and fourth levels is under way, and the general outlook is said to be satisfactory. A diamond drill is also being used in the exploration of the property.

Chambers-Ferland.

A number of narrow but promising veins have been cut in the exploration work along the contact at the Chambers-Ferland property of the Aladdin-Cobalt mining company, but nothing of unusual importance has as yet been encountered, although geological conditions continue favorable.

Huronion to be Re-opened.

Once more arrangements have been made for the re-opening of the old Huronia Mine, in Gauthier township, about twelve miles east from Kirkland Lake. The Huronia has had a somewhat checkered career. For a time it was under option to the Timmins interests, during which time extensive diamond drilling operations were carried on, and a quantity of ore was proven; but not sufficient to warrant exercising the option. A small but more or less out of date mill is on the property. A number of men are now engaged in general work preparatory to the opening of the mine.

Alexo Nickel.

The Alexo Mine, at Porquis Junction, is shipping about a million pounds of ore per month to the Mond Nickel Company, at Coniston. It is understood to be the intention of the management to sink the main shaft to a depth of at least one thousand feet.

Plant on Mondeau Claims.

A steam mining plant has been installed on the Mondeau claims, in the township of McElroy, which are under option to the Kerr Lake mining company, of Cobalt, and a comprehensive plan of exploration and development has been mapped out. Until recently the property was being developed by the use of hand steel, but the installation of the steam plant will speed up operations considerably. According to latest reports, considerable encouragement has been met with at the property.

Davidson.

Early in February it is expected the new mill on the Davidson property will be in operation, which will add another producer to the growing list of Porcupine mines. During the past eighteen months the Davidson has been explored and developed very actively, the results being met with affording good reasons for optimism as to the future of the property. Milling operations will be watched with keen interest for the next few months.

Tough-Oakes.

It is expected that the first annual report of the new management of the Tough-Oakes Mine at Kirkland Lake will be a favorable one. The increased costs of mining and milling for the past year are expected to disclose smaller profits on operations for the year. How-

ever, the physical condition of the mine is understood to be very satisfactory, and it is in this direction that the report is expected to be optimistic. The mine has been developed to a depth of 500 feet, the main shaft having been sunk 400 feet, and this has been supplemented by a winze to the 500-foot level. At each level from the 100-foot down lateral work has been carried on with favorable results. An intrusion of diabase which has been present from the surface down to the present lower workings has served to shorten a number of the ore shoots. Despite this fact, however, there seems to be no reason to doubt that operations will not be carried on with good results to much deeper levels. The first report of the new management is being awaited with more than ordinary interest.

Lake Shore.

The mill at the Lake Shore Mine in Kirkland Lake should be completed by the middle of the present month and by the first of March, at the latest, the mine should be among the list of producers. The mill is among the most modern in Northern Ontario and will have a capacity of close to one hundred tons per day. The ore to be treated has an average value of upwards of \$15 to the ton, and a considerable margin of profit should be shown. There is a large tonnage of ore blocked out underground, besides considerable which has been conveyed to the dumps and can now be sent to the mill with a minimum of effort. The physical condition of the mine would appear to show that no difficulty will be experienced in keeping the ore reserves well in advance of the requirements of the new mill. About the last of January the downward continuation of the main orebody was encountered at the 400-foot level. The width of the vein at this point is approximately 22 feet and for the greater part the ore will average around eight or nine dollars to the ton, while two streaks appear in the vein in which the values are exceptionally high, particularly the last four or five feet passed through along the north wall, where visible gold is liberally sprinkled through the ore. Drifting towards the west was started without delay. Previous to the cutting of the vein at this depth the main workings of the mine were at the 200-foot level, where the results being met with were highly satisfactory. Proving the main orebody to continue to the 400-foot level and maintaining its splendid grade of ore is of the utmost importance to the Lake Shore, and also affords a good deal of satisfaction to those interested in the Teck-Hughes on the west and the Wright-Hargraves on the east, proving as it does the remarkable consistency of the vein system and the mineral deposition.

Porcupine Crown.

The Annual report of the Porcupine Crown mining company, as of December 31st, 1917, is not altogether favorable. The heavy decrease in ore reserves from that of a year ago came as quite a surprise to many. At the end of 1916 the ore reserves of Porcupine Crown were estimated to be \$1,050,000. During the year 1917 the company mined \$364,703, which on the basis of the 1916 ore reserves would leave \$685,297. It is, therefore, somewhat of a surprise to note that the management report only \$610,000 ore reserves left in the mine. During 1917 the workings of the Porcupine Crown were carried to a depth of 1,000 feet, where ore is understood to have been determined, yet there has been a cut in the amount of ore reserves to the extent of \$75,297 in excess of the gold produced. The only explanation which can be found is that the estimates for

the year 1917 are much more conservative than those of the year previous. After paying for mining, milling, allowing for depreciation, taxes, etc., the mining profits were \$109,421, against \$270,130 in 1916. Mr. S. W. Cohen, general manager, said that production had been seriously hampered by a cave-in at the mine during the month of April, which affected operations for about two months and a half and resulted in a considerable quantity of ore still being tied up in the mine. Labor troubles and high cost of materials had also been a detrimental factor in production, resulting in the reduction of dividends. Mr. Cohen further stated that no new ore bodies had been discovered during the year and that ore reserves had been decreased practically by the amount extracted.

Teck-Hughes.

Drifting at the 500-foot level of the Teck-Hughes mine is being attended with good results, according to recent information. The drift is to be continued to a point directly beneath the main shaft, where a raise will be put up to connect the shaft with the 500-foot level. A drift is also to be run from the winze at the 600-foot level to a point beneath the main shaft, where a raise will also be made to complete the shaft to the depth of 600 feet. A large station is to be cut at the 500-foot level and a rock crusher will be installed at this point, the intention being to make this the main haulage way of the mine. Here the ore can be released from the chutes directly into the cars and in which it will be trammed to the underground crusher, where after being reduced to the required fineness, it will be hoisted to the surface for treatment in the mill. The physical condition of the mine is officially stated to be very satisfactory. Since the closing down of the Kirkland Lake Gold, the Teck-Hughes has the distinction of being the deepest operating mine in the Kirkland Lake Camp.

Molybdenite Mining Encouraged.

It is anticipated that there will be considerable scouting done for molybdenum properties in the north country since the announcement by the Dominion Government that the export taxes on the product has been removed. Heretofore the molybdenum mine operators of Canada had a very narrow market for their product and secured perhaps the smallest price of any of the allied countries. The removing of the embargo will provide a much better market for the metal. The molybdenum deposits of Northern Ontario and Northern Quebec, the latter along the Transcontinental railway, should now be in line for considerable attention.

Vipond-North Thompson.

With the 100-ton mill running at almost full capacity and with mill heads recently being bought up to ten dollars per ton, the operation of the Vipond-North Thompson property is understood to be resulting in increasing profits. The mine is being quietly but aggressively developed and the outlook never appeared more favorable. The mine is now in a position where it should respond rapidly to more favorable labor conditions, and a return to pre-war conditions would find the property in excellent shape. The management have deferred the enlargement of the mill until conditions for accomplishing this work are more favorable. Although developments at the property have been confined largely to the main vein, the exploration conducted by diamond drill a few months ago has determined the presence of other valuable ore deposits. The property is bounded on the north by the Hollinger Consolidated

and on the west by the Porcupine Crown, and it is expected a continuation of many of the orebodies of these properties will be found on the Porcupine V.N.T.

Thompson-Krist.

Arrangements have been completed for the commencement of work on the Thompson-Krist property in Porcupine. The work is to be carried on by the Porcupine V. N. T. company from the 400-foot level of the latter mine. The geological conditions are quite favorable to the proving of ore on the Thompson-Krist and the general trend of some of the veins of the Vipond are in a general direction of the Krist.

Skead Mines.

Development work is being pushed ahead vigorously on the properties of the Skead Mines, Limited, in the township of Skead. A force of twenty-eight men are employed at the mine and the shaft has already reached the 100-foot level and a station is being cut preparatory to the commencement of cross-cutting for the purpose of tapping the various veins in evidence on the surface, and which have been indicated at depth by diamond drilling the mining plant consists of a four-drill compressor, hoist and 120 h.p. boiler. Although the Skead Mines is the major operation in this township, there are a number of other promising prospects in that district, among which is the Fidelity Mining company's property, on which arrangements are being made for the beginning of operations in the near future.

White Reserve.

Operations on the White Reserve property in the Elk Lake district are going ahead uninterruptedly. A large mining plant and a full crew of men are employed. A twelve drill compressor and adequate mining equipment to carry on operations to depth is installed. At the present time a cross-cut is being driven at the 140-foot level, with the expectation of encountering the continuation of the veins in evidence on the surface. The White Reserve has been in operation almost continuously for the past two years and is unquestionably the most consistent effort at mine making in the Elk Lake District. The formation is diabase and although very promising, the property is still in the prospective stage.

A Silver Discovery.

A promising silver find is reported to have been made south of Cobalt, at mileage 64 on the T. & N. O. railway, and consists of a four-inch vein, containing silver values. The rock formation in the vicinity is diabase and Keewatin, with some Laurentian and a small area of conglomerate. Already the district is receiving the attention of Cobalt mining men, but up to the present nothing sensational has developed.

Lightning River Claims Sold.

A deal for the Lightning River claims, on which spectacular gold discoveries were made last fall, has been consummated and a second cash payment was made in Haileybury recently. The purchase was made by Mr. George Young, representing strong United States interests, who at the present time are carrying on extensive mining operations in the Western States. This is their first venture in Northern Ontario mining fields. It is understood that a mining plant will be installed without delay and the exploration of the property commenced.

Ankerite.

The downward continuation of the orebody at the Ankerite property of the Coniagas Mining Company in Porcupine has been encountered, at the depth of 200

feet. The orebody is well mineralized and is quite up to the expectations of the management. The three-compartment shaft on the property is being driven to the 500-foot level at record rate. When this level is reached a large station will be cut and lateral work will be undertaken both on the Ankerite and the Maidens-McDonald property, which is also owned by the Coniagas Mining company. It is expected the ore depositions from the Ankerite will be found to continue into the Maidens-McDonald. Results obtaining from present development and results encountered in diamond drilling indicates the Coniagas company have a valuable acquisition in their Porcupine properties.

BRITISH COLUMBIA.

Dissatisfaction has increased among mine operators, as more and more of them have come to realize what a heavy levy last year's tax legislation, which came into effect on January 1st of this year, will make upon them. Various Boards of Trade have taken the matter up, and prominent mine managers have also protested against this additional burden being placed on the mining industry of the province, this being additional to the taxation provided for by the Dominion Government last year. Whether the Provincial Government will or will not take steps at the forthcoming session of the local Legislative Assembly to meet the requests of mining men and others interested, is not yet known. Meanwhile it is claimed that this changed attitude of the government towards the mining industry is having the effect of deterring outside capitalists from putting more money into mining enterprises in the province.

In an official bulletin, issued last month by the British Columbia Department of Mines, there is included a statement which shows the dividends declared by metaliferous mining companies during the calendar years 1913, 1914, 1915, and 1917. The total for 1917 is made to appear to have been \$3,800,847, but in order to make this larger showing than in other years, two companies appear to have been credited with the dividend payments of five quarters each instead of four. The Consolidated Mining and Smelting Company, Trail, is credited with \$1,258,438, and the "Standard Silver-Lead Mining Co., Silvertown Co., Grand Forks" (which, presumably, is a careless misprint for the Granby Consolidated Mining, Smelting and Power Co.) with \$1,874,210. Now, each of the companies—the Consolidated and the Granby—paid four dividends in 1917 at the rate of 10 per cent. per annum, so it is quite evident the official figures have been improperly inflated. It is true, footnotes appended state that there are included \$261,935 for the one company and \$374,362 for the other, "earned and declared in 1917, but payable January, 1918," but even that does not justify the inclusion, in a statement purporting to show the year's dividends of one quarter each for two companies, the amounts of which had been included in the 1916 total. The misstatements were easily avoidable, since several newspapers and journals had already published dividend figures that were within a few dollars of being correct. Further, the Granby Consolidated Co.'s issued capital was \$14,998,520 at the close of its year ended June 30, 1916, and \$15,000,042 as at June 30, 1917, while the Consolidated Mining and Smelting Co.'s recently published annual report showed that at September 30, 1917, its issued capital was \$10,477,450, and that three dividends declared in 1917, prior to September 30, totalled \$784,317.50, so that there remained only the fourth quarter's dividend of \$261,936.25, payable January 1, to add,

253.75. Instead, therefore, of the two companies mentioned having been stated to have declared dividends in 1917 together totalling \$3,132,648, they should have been shown as having declared dividends totalling about \$2,545,500, or approximately \$587,000 less than shown in the official publication here referred to.

East Kootenay.

The Cranbrook Herald recently ridiculed a report to the effect that the American Smelting and Refining Company has decided to establish smelting works in East Kootenay. It is stated that the company is doing diamond-drilling on some mineral claims on North Star Hill, in Fort Steele mining division, which property it holds under option of purchase, but beyond that the big United States company is not spending money in East Kootenay at the present time.

Published official statistics place the coal production of the several collieries in the Crowsnest district of Southeast Kootenay for 1917 at 552,358 long tons of coal, as compared with 882,270 tons in 1916. The quantity used for coke-making was about 187,275 tons, and the output of coke was 129,155 tons, as compared with 240,121 tons in 1916.

Official comment follows: "The output would have been considerably greater had not the Crowsnest collieries met with a series of misfortunes during the year that interfered with production, and, in addition to this, there was a serious shortage of labor—partly caused by the heavy enlistment of the younger men—and in the Fall there were labor troubles."

The collieries that were operated were those of the Crow's Nest Pass Coal Company, at Coal Creek, and Michel, respectively, and the Corbin Coal and Coke Company, at Corbin.

West Kootenay.

Ainsworth.—There is a promise of more attention being given to mines in the Woodberry Creek region, in Ainsworth mining division, this year, than for several years past. Lacking even wagon-road transportation facilities, though, the properties up that creek are under a great disadvantage, since pack-horses have to be used for taking in supplies and bringing out ore, consequently development operations are much restricted.

Mr. A. R. Langley, resident engineer for Eastern Mineral Survey District No. 5, in his published official report, includes mention of the Manganese Group, as follows: "This property is owned by A. J. Curle, of Kaslo, and A. G. Larson, and is situated on the Kaslo & Nakusp railway, six miles and a half from Kaslo. Very little development and mining work have been done as yet. Some 600 sacks of ore are ready for shipment, and the owners claim that a considerable tonnage is available for extraction at low cost. Average assays run as follows: Manganese, 42.06 per cent.; iron, 1 per cent.; moisture, 13.12 per cent.; silica, 4 per cent.; phosphorus, 0.01 per cent. The limited exploratory work done would indicate that the ore occurs as a blanket deposit lying on or near the surface and having a thickness of from 1 to 3.5 feet. This property has possibilities and further work should be done to determine the extent and character of the deposit."

Slocan.—According to a published official bulletin, the Government resident engineer for the district in which this mining division is situated, has reported approximate shipments of ore and concentrates in 1917 from mines in the division as follows: Of ore: Lucky Thought 923 tons, Echo 79 tons, Queen Bess 2,225 tons.

164 tons. Of lead concentrates: Standard 5,200 tons, Galena Farm 1,307 tons, Van-Roi 1,739 tons, Hewitt 157 tons, Surprise 1,830 tons, Slocan Star 1,660 tons, Rambler-Caripoo 902 tons, Ivanhoe 770 tons. Of zinc concentrates: Standard 11,000 tons, Galena Farm 1,490 tons, Hewitt 200 tons, Surprise 2,523 tons, Slocan Star 800 tons, Lucky Jim 2,600 tons. In addition there were a number of mines that shipped smaller quantities of ore.

Nelson.—From Spokane, the headquarters of the managing director of the company owning the mine, has come information that mining operations have been resumed at the Hudson Bay zinc mine, situated a few miles from Salmo, in the southern part of Nelson mining division. An official report states that a considerable quantity of zinc ore was shipped from the mine in the first part of 1917, while the estimate of zinc in ore shipped is 1,800,000 lbs. In his published official report for 1916 the Gold Commissioner for the district gave the following particulars, which will serve to convey a fair idea of what earlier operations were: The H. B. Group is one of the most important groups of mines in the district. Production during eleven months of 1916 was: Zinc ore, 5,401 dry tons, yielding 2,910,675 lbs. of zinc; lead-zinc ore, 1,118 dry tons, yielding 461,980 lbs. of zinc and 182,322 lbs. of lead; total, 6,468 tons, yielding 3,372,665 lbs. of zinc and 182,322 lbs. of lead. Development work done in 1916 consisted of 1,906 feet of tunnel drift and 1,553 feet of diamond drilling. Average number of men employed, 40.

Oxy-Acetylene Welding and Cutting

Making Sheet
Metal Chemical
Tanks by Prest-
O-Lite Process.

"Rivetless" Metal Joining Makes Tanks Leak-Proof

Here is shown how permanently leak-proof sheet metal tanks are made by the Prest-O-Lite Process. The metal sheets are first cut to shape with a Prest-O-Lite cutting blow-pipe. They are then set in position, and all joints are welded by the Prest-O-Lite Process of oxy-acetylene welding. The joints are made stronger, neater, and at less cost than by riveting. All danger of leakage at joints is eliminated.

In REPAIRING as well as in MANUFACTURING the Prest-O-Lite Process is literally "blazing the trail" to efficiency and economy. It saves hundreds of thousands of dollars annually in Canadian factories, machine shops—wherever metal or machinery is used.

Prest-O-Lite
PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium petroleum, platinum, quartz, salt and tale.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured within the Province.

Ontario in 1916 produced 45 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1916 to be worth \$65,303,822, of which the metallic production was \$55,002,918.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

Orders Indicate Marcy Efficiency

Repeat Orders Prove It !

AN INSTALLATION OF NO. 86 MARCY BALL-MILLS

MARCY MILL

CRUSHING
"ONE
EASY
STEP"

We cite the installation of our mill in large mining properties simply for the sake of illustration as to its PROVED efficiency where RESULTS, and results only, win recognition. In such places things are done and changes made only AFTER experimentation has proved the correctness of the step.

Small mines, therefore, can approach the question of adopting the Marcy, with that full confidence which comes from a realization that the leaders of the industry have stamped it with their unqualified O.K.

In the adoption of large numbers of Marcy Mills because of the performances of trial installations you can read the record of what we have accomplished for the mining industry in developing this mill to a high point of efficiency and economy.

Removes Fines and Slimes as Fast as Produced

It takes a coarse feed direct from the crushers and delivers a product of the required degree of fineness for treatment, when operated in conjunction with screens and classifiers.

The liberal discharge area in the welded chrome steel grate, absence of regrinding, little attention required, minimum floor space and small power consumption are reasons for Marcy superiority.

Daily Capacity 25 to 1000 Tons of Coarse Feed

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

USERS of the Callow Cell are naturally interested in knowing how the decision of the United States Circuit Court of Appeals for the Third District, in the Miami case, will affect their interests.

As we understand the prevailing opinion of Judge Woolley in the Miami case he has interpreted the Supreme Court decision in the Hyde case as meaning that "*invention resides not alone in the critical proportion of oil, but also in air and agitation,*" and again, "*in the co-action of the critical proportion of oil and air effected by 'an agitation greater than, and different from that which had been resorted to before,' resulting in a froth concentrate of economical value,*" and further, that the Supreme Court did not limit the patent to "*agitation by mechanical means,*" but to agitation of a violent and persistent kind; "*it mixes the oil with the metal of the ore. This is old. Then, by its greater intensity and longer duration, it stirs the pulp into a froth.*"

Thus, this decision of the Third Circuit Court of Appeals has a most important bearing upon the art, because it holds that the mixing of the oil with the mineral is old, but it **leaves open the use of oil in connection with aeration-cells.** Meanwhile the idea of a "*critical*" proportion of oil has been dis-

proved by practice in several mills within a short time after it was promulgated.

Judge Woolley says further, concerning the Callow Cell: "*Aeration is direct, and is not the result of or caused by agitation. On the contrary, agitation results from aeration and such agitation, though present in some measure, is not even approximately of the violence and duration of the agitation of the patent. The operation in the Callow Cell certainly possesses these distinguishing features from operation of the process where aeration is caused by agitation.*"

The Court further confirms this important dictum by saying: "*If the only agitation to which the pulp was subjected (after such agitation as in the prior art was necessary to mix the oil and ore) was the agitation of the Callow Cells, we would not say that that agitation amounted to or was the equivalent of the violent agitation of the patent disclosure and constituted infringement.*"

Apparently users of the Callow Cell may feel assured they do not infringe the method of agitation described in U.S. Patent No. 835,120 (less than 1% oil), No. 962,678 (soluble frothing agents), No. 1,099,699 (phenol or cresol in the cold without acid) since all three of the patents are of the same process, dependent upon a certain degree of violence and length of agitation and the production of the same characteristic froth, as set forth in their claims.

(Signed) J. M. Callow.

HOMESTEADS

IN THE BANNER HOME PROVINCE OF ONTARIO

20,000,000 Acres of the Finest Agricultural Land in Canada, Waiting for You in the Northern Part of Ontario.

Think of it! Homesteads available at 50 cents per acre—close to railroads—close to markets—close to civilization and attending advantages.

Land of opportunity—you can make yourself a home within a short day's journey of Toronto.

Land lies in one of the best belts of Canada, along the TEMISKAMING AND NORTHERN ONTARIO RAILWAY, which has connections with the G. T. R., C. P. R., C. N. R., and C. G. Railways, thus bringing the settlers within easy reach of the profitable markets of the continent and Europe.

Prosperous towns growing into cities; in this way local markets available to the settler for buying and selling.

You may have a happy home and a fertile farm at 50 cents per acre in your own home Province of Ontario—why, then, go far afield for these ideal conditions?

Exhibits of the products and of the possibilities of production of New Ontario's land have been shown at Canada's National and other Expositions, so that it is now known as Canada's land of production.

Not only land of agriculture, but embraces large and rich mineral belts from which annually millions of dollars of gold and silver are mined.

CANADIAN **MINING JOURNAL**

VOL. XXXIX

TORONTO

No. 5

The time sheets
tell the story,
but---are they
accurate?

This is a vital question in every industrial organization, large or small—vital because it eats into the profits. Solve it and you have eliminated the greatest adverse factor to the successful operation of your plant. Neglect it and an ever-increasing overhead expense will be the result.

Eliminate all this inaccuracy with an **International Time Recorder**

Not only does it give you an accurate, legible and unchangeable record of your pay-roll data, but it also cuts down to a minimum the time needed to make up that data.

We are the largest makers of Time Recorders in the world and our advice is at your disposal—FREE at any time.

There are over 260 different styles and types to suit every kind of business—one of which is particularly adaptable to your own business.

Write our nearest office TO-DAY, telling us the nature of your business and the number of employees. We will advise you what style of Time Recorder to install.

A NEW DIAMOND DRILL

The Sullivan Belted "Bravo"

If you need a core drill for prospecting to moderate depths, one you can take anywhere—and use on the surface or underground, send for this remodelled, gas-engine-driven "BRAVO."

For holes from 50 to 600 feet
 For cores from $\frac{1}{16}$ in. diameter to 2 in.
 Horse power of gas-engine 4
 Weight of drill 500 lbs.
 Weight of frame 640 lbs.
 Weight of engine with pump 1200 lbs.

Improvements in reduction gearing render this "Bravo" especially suitable for belt drive. The gas engine is unusually reliable, compact and economical. ¶ The "Bravo" has been for a generation, the most widely used and most dependable light diamond drill, in use in all parts of the world. It can be run by hand power, as well as by belt drive.

Described in our 68-page Diamond Drill
 Catalogue, No. 669—Ask us for your copy.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

*"Little David" Pedestal
Grinder No. 8.*

The "Little David" Pedestal Grinder will help you to get and maintain the greatest practicable freedom from drill stoppages due to broken drill shanks and pistons, as well as to get the best action when using water and hollow steels.

This grinder may also be used for general grinding purposes

A New "Little David" Grinder

For Squaring Off Rock Drill Shanks,
Dressing Rock Drill Bits and Reaming
the Hole in Shanks of Hollow Drill Steel.

*Saves Piston Breakages
Keeps up Cutting Speed*

This is a new tool for mine use which adds greatly to the efficiency of drill sharpening equipment. While the drill sharpener insures a plentiful supply of sharpened steel, properly formed shanks have much to do with the final results in footage.

*Let us send you Bulletin 4041 which tells
the whole story. Other bulletins are yours
for the asking also.*

Write our nearest office.

MINERS PRODUCE!

Produce to Your Utmost Capacity

THIS is the nation's call at the present time. It is one of the vital necessities of the Great War that the entire metal industry increase production to its utmost capacity.

The "New Cleveland" Type S Stopers will increase your output and yet cut down the cost of drill upkeep.

And more than that—they stay on the job more constantly and cost far less for repairs. They use less air and operate more smoothly than other drills. The speed and power of the blow enables the runner to break previous records.

Write for Bulletin No. 35-A which fully describes the "New Cleveland" Type S Stoper.

View showing R. c. and P. c. c. from Bayhead

LEYNER SHANK AND BIT PUNCH

As already stated, the operation of a hot lamp press is simplified because the material is now all prepared by the consistency of the material in the rough of the previous stretching of the lamp to size. As the lamp is moved in and out of the pressing platen which in turn operates the right and left hand rollers, a spreading motion along the jaws of the lamp press in case may be

To prevent this condition, the motor is ground, starting with the series of the end and parallel bases are covered by a middle ground. Further, the protruding end of the rack gear is not allowed to move, so that by the possibility of the motor injured or destroyed the operation.

Standard Equipment

3. The standard equipment consists of a two-line sample α with pushing pin β' and meter for β' (see a 2nd fig.) and the remainder of the pin being α'' (character two) which is automatic lubricator (an extension β'' pipe to which the air hose is attached) to force not only the air hose (this extra

The Leyner Shank & Bit Punch

Punches either shanks or bits. It is quick in action. Handles all sizes of drill steel. One lever controls all operations. Air consumption low.

The Leyrer Sharpener makes and sharpens the drill bits and shank, the Shank and Bit Punch will keep the holes open in hollow drill steel, and the Grinder will square up the drill

shanks. Altogether this combination insures perfect drill steel, and that means lower costs, more drilling speed and fewer drill repairs.

Ask our nearest office for Bulletins 4039, 4041 and 4122. They may point the way to important savings.

Symons Disc Crushers

IN STOCK

We will offer specially attractive prices on the 36-inch Disc Crushers, in order to move this stock. This is a rare opportunity to buy a Disc Crusher at a Bargain.

The Disc Crusher Principle

The crushing is done between two discs of manganese steel. Fig. 2950 shows the discs in proper position. Fig. 2949 shows them in cross-section. They are dish-shaped and are set with their hollow or concave sides facing each other, forming a cavity between them.

These discs both rotate in the same direction at the same speed. The discs are supported at an angle to each other. This provides a wider opening between the edges of the discs at one part of their circumference than at the opposite part.

When stone is fed through the central feed opening it is thrown by centrifugal force, into the opening where the discs are widest apart. It is carried around with them to where they are closer together and is crushed in the operation. The smaller particles fly out from between the discs, into the encircling chute, while the larger particles are caught again and the operation repeated.

Fig. 2949 Fig. 2950

The 36 inch Symons Disc will take 5-inch ore or stone and reduce it to $\frac{3}{4}$ inch at one operation.

CARBIDE LAMPS

WORK WITHOUT WATCHING

"Time's [like] money—the less we waste, the further we make it go."

When a miner stops to regulate his lamp he must stop his regular work—time wasted—the same when he stops to recharge.

ITP lamps never need regulating. The Float Feed automatically rakes the carbide, and as they burn from 9 to 10 hours they never require recharging during a shift.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167 603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

PITTSBURG, PA.

is the trade-marked name for pasteurized separated

ONTARIO MILK

in dry form. Government Inland Revenue Bulletin No. 257 states that separated milk powder "contains no adulterants," "is true to the claims made for it" and is genuine."

Klim is the most economical form of milk. It bulks smallest and weighs less than any other form of milk, thus effecting over 50% saving in freight charges. It remains sweet and fresh indefinitely. Can be used from the tin as needed. No waste from spoiling. Mix dry with flour, sugar, etc., in cooking or dissolve in water for use as liquid.

A miner's wife writes: "I have used Klim for everything, with most satisfactory results."

Klim is sold in 1-lb. tins and 10-lb. tins. The larger size is more economical. Ten lbs. makes forty quarts of liquid with the natural milk test.

The shortage of coal has directed a great deal of attention to the necessity of more fully utilizing inferior fuels. This should be done, as far as possible, without delay; but even greater attention should be given to means for more fully utilizing, especially during the war, the best grades of coal. Nova Scotia has splendid coal that should be more extensively used in Eastern Canada and the North Eastern States. Alberta and British Columbia coal mines can supply excellent coal for Western Canada and the North Western States. Ontario should get most of its coal from the nearby mines in the United States. This is no time to attempt to supply all Canada with Canadian fuel. The best interests of Canada and the United States demand more complete utilization of the best grades of coal near the points of production, regardless of the boundary line.

The annual meeting of the Canadian Mining Institute will be held at the Windsor Hotel, in Montreal, on March 6th, 7th and 8th.

Control of metals after the war is a matter that must receive careful attention. Before the war, Germany had acquired control of a very considerable portion of the metals used in Europe in addition to the needs of Germany itself. German metal merchants secured control of metals, ores and concentrates produced in various parts of the world, and so Germany was in an admirable position to secure what seemed to be ample stocks before declaring war. Fortunately, she failed to secure a sufficient supply of such metals as copper and nickel for such a war as this has become. We should see to it that, so far as we are able, Germany never again secures more Canadian metals than enough to supply her ordinary needs for peaceful pursuits.

Germany was for years a storehouse of metals gathered from all parts of the world, ready for war and controlling the market, so that German metal dealers could secure handsome profits on practically all the metals imported by European countries. The surplus stock was sold at prices fixed by the Germans, and an ample, or what was believed to be ample, supply for war purposes was always in their control. Thus they carried on a lucrative business, provided for their needs for industrial purposes and their supposed needs for war purposes and worked against the natural development of metal industries in other countries.

A merger of the Dominion Steel Corporation and the Nova Scotia Steel and Coal Company has been frequently talked of, and now seems likely to be accomplished. The officials concerned have not given out information which would indicate that the two companies have finally joined forces; but their replies to queries indicate that negotiations are well advanced.

As these two companies produce four-fifths of Eastern Canada's coal and nearly all the iron and steel of the Maritime Provinces, the merger is one of unusual importance. If it is accomplished, we may soon expect to see Nova Scotia take a much more prominent place in the industrial world. Already the Eastern Province has an enviable position as a producer of coal, iron and steel, and has played a big part in supplying these necessities; but there remains to be developed a host of subsidiary enterprises.

A greater variety of iron and steel products than is now obtainable in Canada will probably be one of the results of a merger of the two Nova Scotia companies. This will naturally be followed by the establishment in Nova Scotia of many manufacturing plants.

MEMORANDUM.

Re Mining Industry submitted by a Deputation representing the Canadian Mining Institute.

Feb. 8, 1918.

To the Right Hon. Sir Robert Borden, P.C., G.C.M.G., K.C., LL.D., Prime Minister of Canada,

The Council of the Canadian Mining Institute desires to present for your consideration the following matters directly connected with the Mining Industry, and which, it is believed, will be of material aid to the Dominion, not only in this time of its stress and burden, but also in the immediate future when the burdens of reconstruction and recuperation will bear heavily upon the Government and the people of this Dominion.

We realize that the great importance of increasing sources of revenue, and the need for the exercise of the strictest economy in the expenditures of the administrative departments is fully appreciated by your Government. It is believed that, of all Canadian industries, that of mining possesses the greatest possibilities for profitable expansion, inasmuch as no established business is entirely independent of the mineral industry or its products. Therefore, it is manifest that measures having for their object the stimulation of discovery and effective exploitation of Canadian mineral resources, should have your Government's immediate attention and be made rapidly effective, since effectiveness in this direction depends, to a very large degree, upon the policy and assistance extended by Government.

It is our opinion that this assistance can be best given through the Department of Mines, to which Department the task should be entrusted, and we also respectfully submit that much of the past and present dissipation of funds and energy can be avoided through non-duplication of effort by different branches of the Civil Service and Commissions. In the immediate past identical information has been sought through at least three different bureaus, two of which were not correlated with the Department of Mines. A unification of all such efforts through a recognized and extended Department of Mines is, therefore, greatly to be sought, and can unquestionably be obtained if your Government so desires. It is earnestly hoped that your Government may seriously consider the information which accompanies this request.

Strengthening of the Department of Mines: From the year 1841 to 1907 the Geological Survey of Canada carried on exclusively the obtaining of information respecting the mineral resources of Canada. Under a Minister of the Crown, and more directly under an officer known as the Director of the Geological Survey, excellent work was accomplished and a permanent record made.

In the year 1907 by 6 and 7 Edward VII, Chapter 29, "The Geology and Mines Act" was passed, whereby the Department of Mines was created and placed under the administration of a Minister who was also the head of another Department of the Government of Canada. Provision was thereby made, and, it is believed, erroneously made, for the division of the Department into two branches, one called "The Mines Branch," and the other called "The Geological Survey."

By Section 6 of the said Statute, the functions of the Mines Branch are:—

(a) To collect and publish full statistics of the mineral production and of the mining and metallurgical industries of Canada, and such data regarding the economic minerals of Canada as relate to the processes and activities connected with their utilization, and to collect and preserve all available records of mines and mining works in Canada;

(b) To make detailed investigations of mining camps and areas containing economic minerals or deposits of other economic substances, for the purpose of determining the mode of occurrence, and the extent and character of the ore-bodies and deposits of the economic minerals or other economic substances;

(c) To prepare and publish such maps, plans, sections, diagrams, drawings and illustrations as are necessary to elucidate the reports issued by the Mines Branch;

(d) To make such chemical, mechanical and metallurgical investigations as are found expedient to aid the mining and metallurgical industry of Canada;

(e) To collect and prepare for exhibition in the Museum, specimens of the different ores and associated rocks and minerals of Canada, and such other materials as are necessary to afford an accurate exhibit of the mining and metallurgical resources and industries of Canada.

By Section 7, the functions of the Geological Survey are:—

(a) To make a full and scientific examination and survey of the geological structure and mineralogy of Canada; to collect, classify and arrange for exhibition in the Victoria Memorial Museum such specimens as are necessary to afford a complete and exact knowledge of the geology, mineralogy, palaeontology, ethnology, and fauna and flora of Canada, and to make such chemical and other researches as will best tend to ensure the carrying into effect the objects and purposes of this Act;

(b) To study and report upon the facts relating to water supply for irrigation and for domestic purposes, and to collect and preserve all available records of artesian or other wells;

(c) To map the forest areas of Canada, and to make and report upon investigations useful to the preservation of the forest resources of Canada;

(d) To prepare and publish such maps, plans, sections, diagrams and drawings as are necessary to illustrate and elucidate the reports of surveys and investigations;

(e) To carry on ethnological and palaeontological investigations.

It is interesting to note that by Section 4 of the Statute it was contemplated that there should be transferred to this Department for consideration and action, all related subjects from other Departments, with the object, apparently, of entrusting to the Department of Mines all that it was possible to assign to it within the terms of its functions. So much was this the case that by Section 21, the forestry resources of the Dominion were referred to this Department to be dealt with in the following manner:—

The Minister may, for the purpose of obtaining a basis for the representation of the mineral, mining and forestry resources, and of the geological features of any part of Canada, cause such measurements, observations, investigations and physiographic, explanatory and reconnaissance surveys to be made as are necessary for or in connection with the preparation of mining, geological and forestry maps, sketches, plans, sections or diagrams.

The reason why it is believed that the division of the functions of the Department of Mines, as by the Statute provided, is erroneous, is that in practice it has led to overlapping, to divided authority, and to friction arising out of sectional jealousies.

No Real Minister of Mines.

Probably the reason for these difficulties has been, as much as for any other, that the Minister has never been charged with the sole purpose of attending to the mining industry, has always had other manifold duties to perform, and has never been long enough in office to enable a continuity of policy, such as should have existed in respect to so important a subject.

It is enough to recall to your attention in this connection that there have been, in the last six years, no less than eight Ministers or Acting Ministers of Mines.

We are firmly convinced that if a Minister of Mines charged solely with the work of this Department were to give his undivided attention to it, much that has occurred would have been avoided, and will be avoided in the future.

The Conservation Commission.

The scope of the work of the Department of Mines is wide; but instead of encouraging the Department to fully perform its duty, from time to time, Commissions—some Statutory, some appointed by Order-in-Council, and some more or less self-appointed—have encroached upon the domain of the Department of Mines, have been encouraged by the Government of the day in so doing, have been granted sums of money to spend upon subjects and matters that should properly have been dealt with by the Department of Mines, but for which that Department could never obtain the necessary funds.

The first apparent inroad was made by the Government in the year 1909, when it passed an Act Respecting the Commission of Conservation, 8 and 9 Edward VII, Chapter 27. By Section 10 of that Statute, it is provided that:—

It shall be the duty of the Commission to take into consideration all questions which may be brought to its notice relating to the conservation and better utilization of the natural resources of Canada, to make such inventories, collect and disseminate such information, conduct such investigations, inside and outside of Canada, and frame such recommendations as seem conducive to the accomplishment of that end.

By Section 12, it is provided that no permanent officer or employee shall be appointed by the Commission. This was a modest programme. By 3 and 4 George V, Chapter 12, Section 1, all this was changed. We beg to refer you to a publication entitled "Catalogue of Publications revised to December 1st, 1913," and published by the Commission of Conservation of Canada, at page 27, and the annual reports since that date, and ask you to consider to what extent the work undertaken by the Commission might have been done by the Department of Mines.

We beg to call your attention, also, to the tendency to duplicate work rightfully belonging to the Department of Mines, evidenced by some of the publications of the Natural Resources Division of the Department of the Interior, and the Mines Branch of that Department.

The Munition Resources Commission.

A later encroachment, but by no means the least, upon the domain of the Department of Mines, was the appointment, since the outbreak of the war, of a Munitions Resources Commission, whose function it was, and is, to advise the Imperial Munitions Board on the available Canadian minerals for use for war purposes. There had previously been in existence a Shell Committee. This was disbanded and members of it were reappointed as the Munition Resources Commission, with the addition of one member from the Department of Mines, for the same purpose as mentioned.

We are of the opinion, and very firmly of the opinion, that the duties of this Commission, for which duties the Department of Mines was created and is essentially suitable, could have been well performed by that Department, with the co-operation of the Canadian Mining Institute and the Provincial Departments of Mines.

Dissemination of Energy Leads to Useless Waste.

All this dissemination of work and effort, this duplication of work, and misplacement of confidence, leads to large expense, useless extravagance and waste, and a destruction of the virtue, opportunity and effectiveness of a Department long in the field, well equipped and capable of doing the work that is being taken away from it. One can, of course, destroy the efficiency and reputation of any Department of the Government by robbing it of its duties, and having them performed by others supplied with moneys which should have been voted to the Department thus impaired. Every branch of mining, everything pertaining to minerals, all laboratory and technical work, and all research in respect to these matters, should be committed to the various divisions of the Department of Mines, each presided over by a qualified technologist. The Department is well equipped with laboratories, which could be enlarged as necessity demands.

National Importance of Mining:—In 1915, the mining, smelting, and related industries of Canada employed 104,425 men and yielded products of a value of \$265,046,000. In addition, and directly following this production, 50,393 men were employed in further manufacturing these products, giving to them an added value of \$103,912,000. That is to say, of a total of 2,723,000 wage-earners in Canada, one-ninth are employed in the mining and dependent industries.

As a further indication of the importance of the mineral industry from the national standpoint, it may be noted that, in 1915, the tonnage supplied to railways by the different industries was:

Products of mines	37.89%
Products of agriculture	18.79%
Products of forest	16.03%
Manufactures	14.76%

Raw Materials Should Be More Largely Utilized in Canada.

Whilst the imports of crude mineral products are only slightly in excess of a similar grade of exports, it is noted that a great quantity of manufactured products is imported; and much exported in a raw stage that should be more highly finished in Canada. That is to say, not only are we re-purchasing materials manufactured from our own exports, but are not obtaining the greatest return from what we do sell as a surplus above our requirements, e.g., asbestos, magnesite, nickel, copper, zinc. It is felt that by a more vigorous policy, the Department of Mines, by studying more intensively the preparation of raw materials, the need of consumers and possibilities of expanding consumption, could greatly stimulate and assist in having our raw materials marketed and exported in a more highly finished form with a consequent greatly enhanced return to the producer. For instance, at present most of our asbestos is exported in the raw state. Whilst the lower grades which go into heavier products will probably always have to be manufactured near the point of consumption, yet it would seem that the higher grades might be manufactured equally well in Canada, and to the great advantage of the country. The need for close co-operation between Canada and other parts of the Empire to insure that the metal requirements of the Empire, for both war and peace, be made from the joint resources, is now realized.

Trade After the War:—The Right Honorable Lloyd George, in recently proposing his peace terms before the Trades and Labor Council of Great Britain, said:

"Economical conditions at the end of the war will be in the highest degree difficult, owing to the diversion of human effort to war-like pursuits. There must follow a shortage of raw materials, which will increase the longer the war lasts, and it is inevitable that those countries which have control of raw materials will desire to help themselves, and their friends first. Apart from this, whatever settlement is made, will be suitable only to the circumstances under which it is made, and as those circumstances change, changes in the settlement will be called for."

Alfred Ballin, organizer and administrator of the German shipping trust, in a recent letter to Dr. Ratheman, of Berlin, remarked as follows: "You do not believe in the silly assertion that after the war these British markets for raw materials will be open to us? What a prospect? Out of the British Empire are produced countless articles on which we have hitherto relied and which will be indispensable in the future if we are to swim and not to sink."

These quotations indicate why Canada should be ready after the war with all the raw materials that she possesses, not only for the use of the Empire and for export, but more essentially to manufacture them as far as practicable within the confines of the Dominion.

The control of the Canadian metal trade, as far as possible, should be in our own hands. When one reads the report of the Federal Trade Commission of the United States for 1916, on "Co-operation in American Export Trade," there is ground for alarm at the growth shown of outside influence in metal control before the war. There should undoubtedly be co-operation between Canada and other parts of the Empire to insure that the metal requirements of the Empire for both war and peace, be made from the joint resources; and, in this connection the Department of Mines should concern itself more directly with promoting commercial interests in connection with mining. Invaluable work has been done in the past, mainly in the study of resources; but the information in respect of resources should be correlated with that relating to trade, and in general all matters pertaining to the welfare, development and progress of mining, should be made the business of the Department. For the proper performance of this function it is essential that the two branches of the Department, as at present constituted, should be united.

Stimulation of Exploration for Minerals:—It is probably no exaggeration to state that two-thirds of the total area of Canada represents waste land which can never be of value unless it shall prove to be mineral-bearing. In Eastern Canada is a vast region comprising 1,800,000 square miles, underlain by rocks of pre-Cambrian age. In this pre-Cambrian region, where it extends into the States of Minnesota, Michigan, and Wisconsin have been found the immensely valuable copper deposits of Michigan, and the great iron ranges which have made the United States the foremost producing country of iron ore in the world. Along the thin line of settlement in Ontario, in the Canadian pre-Cambrian, exploration has resulted in the development of the greatest nickel-producing mines in the world, and two other uniquely rich mineral producing areas, namely, those of Cobalt and Porcupine. Recently, in the pre-Cambrian of Manitoba and Saskatchewan, exceedingly promising mineral discoveries have been made, and are being developed. As yet, however, a very small portion of this potentially rich mineral area has been systematically explored and

prospected, and every possible endeavor, therefore, should be made to facilitate and encourage endeavor in this direction. Incidentally it may be pointed out that much may be expected from thorough exploration of those sections of the country, underlain by pre-Cambrian rocks, that will become accessible upon the completion and operation of the new railway to Hudson's Bay. The establishment of a successful mining industry in this northern field would, moreover, contribute very materially to the profitable operation of the railway.

In the West, through British Columbia and northward into the Yukon, is the extension of the Cordillera Mountain system, which in Mexico and the United States has, it is estimated, produced minerals to the value of over \$3,500,000 for each mile in length of these mountains. Within Canadian territory the mountains comprising this system have an approximate length of 1,600 miles, by an average breadth of from 500 to 800 miles. Here, also, exploration has been of a very restricted character. These statements sufficiently indicate the opportunities that exist for mineral exploration in Canada, and the desirability of devoting special attention to the problem of inducing it. In this connection the practicability of training returned soldiers to become explorers, and of offering them certain inducements or incitements to adopt this calling, might be considered.

A Mines Act:—In order to encourage prospecting on Crown lands, under Federal control, it is essential that the provisions governing the securing of title should be of a satisfactory and permanent character. The Regulations in respect of tenure to mining lands have hitherto been established by Order-in-Council, and being subject to amendment under conditions that do not permit of the public being fully advised of such change, are detrimental because of their instability and of the uncertainty thereby occasioned. The Canadian Mining Institute has urged repeatedly upon the Government the wisdom of withdrawing the Orders-in-Council relating to mining, and substituting therefor laws in the form of a Statute. In 1910 the Minister of Mines charged the Institute with the preparation of such a Statute. It entered upon the task with diligence and care, and produced what, it is believed, embodies the desires of those engaged in mining in Canada. The result was printed and circulated by the Government, but has never been presented to the House. There were two sources of objection to its presentation—one the Department of the Interior, from which it would remove the disposition of mining lands, and the other, the member for the Yukon, who disagreed with that portion of the Bill applicable to placer mining in the Yukon. May we be permitted to again strongly urge upon the Government the desirability of bringing this Mines Act into effect.

We confidently believe that if careful consideration be given to the above representations, and remedies are provided along the lines suggested, there will result very great immediate economies to the State; very considerable additions to the efficiency of the Department of Mines; very large economical and financial gain to the Dominion of Canada at a time when this country needs every source of revenue from raw materials to the very limit of possibility. In our humble opinion, there is nothing that will increase the revenue of Canada more substantially than procedure of the Government along the lines above indicated.

All of which is respectfully submitted on behalf of the Council of the Canadian Mining Institute.

Preliminary Report on Production in 1917

By John McLeish.

It is customary to express the total mineral production and to make comparison of production in different years in terms of dollars, or total values.

On this basis of record and comparison the total value* of the metal and mineral production in 1917, as shown in this Preliminary Report, was \$192,982,837. Compared with a production in 1916 valued at \$177,201,534, an increase of \$15,781,303, or 8.9 per cent., is shown, while compared with a production in 1915, valued at \$137,109,171, there is shown an increase of \$55,873,666, or 40.8 per cent.

It must not be inferred, however, that because such a large increase is shown in the value of our mineral production, that our mines and quarries have actually increased their tonnage output at the same average rate. In fact, an examination of the record will show that the quantities of many important products were considerably less in 1917 than in 1916, and over two-thirds of the increase in value is to be attributed to coal, gypsum and cement, in which the quantities marketed were less than in the previous year.

The interrelation of industry is shown by the effect of a diminished coal and coke output on the metallurgical production, the falling off in production of copper and gold is in part attributable to this cause. Lead and silver also show much smaller output. As against these decreases there has been an important increase in the production of zinc and increases also in the production of cobalt, molybdenite and nickel.

In 1916 the metal production showed a very large increase over that of the previous year, but in 1917 the net result in value has been an increase of only \$311,387, making a total value of \$106,630,752.

The total value of the non-metallic production, including clay and quarry products, in 1917, was \$86,352,085, as compared with \$70,882,169 in 1916, showing an average increase of \$15,469,916, or 26 per cent. Practically every product, with the exception of the stone quarry output, shows an increased value of production; but in the case of coal, graphite, gypsum and cement, the quantities actually marketed were less, notwithstanding the increased values.

Copper.

The production of copper in 1917 amounted to 108,860,358 pounds valued at \$29,588,254 as against 117,150,028 pounds valued at \$31,867,150 in 1916, a decrease of 7.08 per cent. in quantity and 7.15 per cent. in value. Though less than the previous year the 1917 production was greater than any other previous record. In 1916 the increase over the production of 1915 had been 16.2 per cent. in quantity and 83.0 per cent. in value.

The electrolytic copper refinery installed at Trail, B.C., began operations about November 1st, 1916, with

a capacity of 10 tons of refined copper per day, which has been increased to 20 tons per day.

Of the total 1917 production 86,508,758 pounds was contained in blister copper and in matte produced in Canada and 22,351,600 pounds estimated as recovered from ores exported.

In addition to the recoveries from domestic ores there were also recovered in British Columbia smelters 5,033,630 pounds of copper from imported ores.

The production in Quebec from pyrite ores was 5,013,560 pounds valued at \$1,362,636 as against 5,703,347 pounds valued at \$1,551,424 in 1916. These are the quantities reported as being paid for; the actual metal contents were much higher.

The Ontario production is derived chiefly from the nickel-copper ores of the Sudbury district and of the Alexo mine in Temiskaming supplemented by a small recovery from the Cobalt district silver ores and by shipments made from a few copper properties under development. The total production in 1917 amounted to 42,796,213 pounds valued at \$11,632,014 as against 44,997,035 pounds valued at \$12,240,094 in 1916, a decrease of 4.0 per cent. in quantity.

There was an important copper production in Manitoba in 1917 derived from the ore deposits at Schist Lake north-west of the Pas, operated by the Mandy Mining Company. These sulphide ores as well as those at Flin Flon Lake in the same district have had a very large amount of development work expended upon them during the past two years. The ore shipments which amounted to 3,388 tons were made under great difficulty of transportation having been hauled 40 miles by sleigh in winter and then 190 miles by barge during summer and then 1,500 miles by rail to the smelter at Trail.

The British Columbia production was 57,717,535 pounds valued at \$15,687,631, as against 63,642,550 pounds valued at \$17,312,046 in 1916—a decrease in quantity of over 9 per cent.

The production included 40,720,413 pounds recovered in blister and matte and 16,997,122 pounds being the estimated recovery from ores shipped to United States smelters.

The production from the Yukon in 1917 amounted to 2,182,050 pounds valued at \$593,081, as against 2,807,096 pounds valued at \$763,586 in 1915. The production is derived from the mines of the Whitehorse district in southern Yukon.

Prices:—The New York price of electrolytic copper, which was 28¾ cents early in 1917, increased to a maximum of 32 cents towards the middle of February though small lots sold as high as 34 cents. Then there was a gradual falling off till it reached 24½ in July. The price remained uncertain until October, when the United States War Industries Board fixed, by agreement with the copper producers, the price at 23½ cents which remained the price for the last quarter of 1917.

*In presenting a total valuation of the mineral production as is here given, it should be explained that the production of the metals copper, gold, lead, nickel, silver, and zinc is given as far as possible on the basis of the quantities of metals recovered in smelters, and the total quantities in each case are valued at the average market price of the refined metal in a recognized market. There is thus included in some cases the values that have accrued in the smelting or refining of metals outside of Canada.

The Mineral Production of Canada in 1917.

(Subject to revision).

Grand Total, 1917

* Tons of 2,000 lbs. \$192,982,837

(a) Shipments by mine operators. The final shipments of ores and concentrates (including customs mill shipments) were 23,327 short tons valued at \$572,115 and containing 8,465 tons of Cr₂O₃.

(b) Owing to delay in receipt of returns, the value of the production of barytes and the value of part of the production of asbestos is not included in the total value.

Gold.

The total production of gold in placer and mill bullion and in smelter production in 1917, is estimated at 747,366 fine ounces valued at \$15,449,426 as compared with 930,492 fine ounces valued at \$19,234,976 in 1917, a decrease of \$3,785,550, or 19.68 per cent. This has been the lowest since 1912 when the new Porcupine field caused a considerable increase in Canada's production of gold.

The 1916 production had been the largest since 1902 when the Yukon output began to decline. The maximum production recorded was \$27,908,153 in 1900 and the lowest since that year was \$8,382,780 in 1907.

Of the total production in 1917, \$4,199,563, or 27.5

per cent. were derived from placer and alluvial mining; \$9,433,033, or 61.0 per cent. in bullion and refined gold; and \$1,816,827 or 11.5 per cent. contained in matte, blister copper, residues and ores exported.

The production in Nova Scotia was only \$45,478 in 1917, about equal to that of 1913, which was the lowest ever recorded and showed a decrease of over 51 per cent. from that of 1916. The decrease is mostly attributed to the great increase in cost for labour and material.

The production in Quebec is made partly from the pyrites ores of the Eastern Townships and partly from the zinc-lead ores of Notre Dame des Ange, Portneuf county. Much of this gold is not paid for by the smelters.

The Ontario production of gold was \$8,916,113 being about 58 per cent. of the total production for Canada and though it shows a decrease of 12 per cent. from that of 1916, it was the second highest ever recorded.

The production from Manitoba \$9,137 though small, points to the possibility of this province becoming an important producer. The gold was derived from the gold and copper ores of Herb and Schist lakes of the new Pas mining division in northern Manitoba.

The production in British Columbia in 1917 was \$2,776,558, a decrease of nearly 39 per cent. which was due not only to the high cost of supplies but also in part to labour troubles in that province and the closing down for several months of the Rossland mines which contribute largely to the output of gold.

The production from the Yukon Territory amounted to \$3,671,008, or a decrease of over 16 per cent., and included in addition to the alluvial gold, a small recovery from the gold and copper ores of the Whitehorse district and the gold-silver-lead ore of the Mayo district.

The exports of gold bullion, gold bearing dust, nuggets, gold in ore, etc., in 1917 are reported by the Customs Department as \$15,929,051.

Lead.

The earlier estimates of the production of lead in 1917 included the recoveries of considerable quantities of lead from imported ores. The total production in 1917 of lead in bullion credited to Canadian mines together with the lead estimated as recoverable from ores exported was 32,072,269 pounds, which, at the average price of lead in Montreal, 11.137 cents per pound, would be worth \$3,571,889. The corresponding production in 1916 was 41,497,615 pounds, valued at \$3,532,692, an average price of 8.513 cents. The decrease in quantity was 9,425,346 pounds, or 22.7 per cent., but on account of the higher price there was a slight increase in total value.

There is such a divergence between the records of lead contents of ores and concentrates shipped and recoveries at smelters from domestic and imported ores that the following records are presented for comparison:

	1916	1917
	Pounds	Pounds
(1) Production: Smelter recoveries from Canadian ore and recoverable lead in ore exported	41,497,615	32,072,269
(2) Lead contents of ores and concentrates shipped from mines in Canada	54,124,628	37,624,567
(3) Total production of lead bullion in Canada (including lead from imported ores) ..	43,100,236	41,427,304

The 1917 production included 30,077,230 pounds of lead in bullion of which a large portion was electrolytically refined and 1,995,039 pounds recoverable from ores exported. The lead bullion was produced chiefly at Trail with small contributions from smelters at Kingston and Galetta, Ont. (The total production of the smelters, including lead from imported ores, was, as noted above, 41,427,304 pounds.) The lead ores exported were derived from Notre Dame Des Ange, Que., the Surprise mine, Slocan, B.C., and the Silver King mine at Mayo, Yukon.

The total mine shipments of lead ores and concentrates was about 58,801 tons containing 37,624,567 pounds of lead as compared with shipments in 1916 of 84,516 tons containing 54,124,628 pounds of lead.

The exports of lead in 1917 were lead contained in ore concentrates, bullion, etc., 13,410,400 pounds valued at \$925,056. Exports in 1916 were: Lead in ore, etc., 9,048,400 pounds valued at \$558,180 and pig lead 112,100 pounds valued at \$7,710.

The average price of lead in January was 9.50 cents per pound advancing to a maximum of 14.62 cents in June, and falling again to 7.92 in November, and 7.96 in December, the average for the year being 11.137 cents. This is the producer's price for lead in car lots as per quotations furnished by Messrs. Robertson and Company.

Nickel.

The production of nickel in 1917 has, as usual, been derived from the ores of the Sudbury district, supplemented by the recovery of a small quantity of metallic nickel, nickel oxide and other nickel salts as by-products in the treatment of ores from the silver-cobalt-nickel ores of the Cobalt district.

The total production was 84,470,970 pounds worth at 40 cents per pound \$33,778,388, compared with 82,958,564 pounds valued at \$29,035,497, or 35 cents per pound in 1916.

Sudbury District: The total production of nickel-copper matte at the smelter of the Canadian Copper Company and the Mond Nickel Company in the Sudbury District was 78,897 tons containing 83,773,319 pounds of nickel and 42,392,588 pounds of copper, the average percentage of the combined metals in the matte being about 80—the tonnage of ore smelted (part being previously roasted) was 1,453,661 tons which, as usual, included a small tonnage from the Alexo mine in the Timiskaming District. The production in 1916 was 80,011 tons of matte derived from 1,521,689 tons of nickel copper ores smeltered, the matte containing 82,596,862 pounds of nickel and 44,859,321 pounds of copper.

The refinery under construction at Port Colborne, Ont., by the International Nickel Company had not been completed at the close of the year. The British American Nickel Corporation continued the development of its nickel properties, particularly at the Murray mine, and work was begun on the first unit of the smelter a mile distant from the Murray mine. It is expected that construction work on the refinery will be begun early in 1918.

Nickel was recovered as a by-product in smelters at Deloro, Thorold and Welland, from the silver-cobalt-nickel ores of the Cobalt district. Complete returns have not yet been received, but the total nickel contents of nickel oxide, nickel sulphate and metallic nickel produced have been estimated at about 697,000 pounds.

The products recovered in 1916 included 79,360 pounds of metallic nickel; 323,418 pounds of nickel oxide and 232,450 pounds of nickel sulphate having a total reported value of \$132,896 and containing 361,701 pounds of nickel metal.

The exports of nickel in ore matte or other form are reported by the Customs Department as 81,272,400 pounds valued at \$8,708,650.

The imports of nickel into the United States during the eleven months ending November, 1917, which included small quantities from other sources as well as from Canada, are recorded as 69,265,880 pounds contained in ore, matte, or other form valued at \$8,869,824, or an average of 12.81 cents per pound. The exports of nickel and nickel oxide, etc., during the same period, were 21,430,306 pounds valued at \$8,702,727 or an average of 40.61 cents per pound of which about 66 per cent. were consigned to Great Britain and 30 per cent. to Italy and France.

The values per pound of these exports to different countries ranged from 38.5 cents to 48.6 cents per pound. The average value per pound of exports in 1916 was 38.775 cents the range being from 37.13 cents to 45.21 cents. The average export value in 1914 was 34.26 cents.

The price of refined nickel in New York according to quotations published by the Engineering and Mining Journal continued at from 45 to 50 cents per pound for ordinary forms with 5 cents more per pound asked for electrolytic nickel, until March 7 from which date the quotation was from 50 to 55 cents.

Silver.

The production of silver in 1917 was 22,150,680 ounces valued at \$18,034,419 as against 25,459,741 ounces, valued at \$16,717,121 in 1916, a decrease

CAPTAIN O. E. LEROY

(Killed in action)

of 13.0 per cent. in quantity, but an increase of 7.9 per cent. in value.

The high value of the production in 1917 was exceeded only in 1912 and 1913, when the Cobalt camp was at the maximum of its output.

The production in Ontario amounted to 19,254,616 ounces valued at \$15,676,531, or 87.0 per cent. of the total production for Canada. In 1911, the year of its maximum production, the percentage was 93.8. The production was from the ores of Cobalt and adjoining silver camps, with the exception of 80,863 ounces, the output of the gold and copper mines.

Of the Cobalt district, production amounting to 19,173,753 ounces, 85.3 per cent, or 16,363,605 ounces were recovered in smelters and reduction works in Canada, and the balance 14.7 per cent., or 2,810,148 ounces were exported for smelting. Of the bullion produced in Ontario 9,929,326 ounces, or 60.7 per cent. was recovered in the mills of Cobalt and 6,434,279, or 39.3 per cent. recovered in southern Ontario smelters.

The production in Quebec was 217,191 ounces valued at \$176,830, as against 98,610 ounces valued at \$64,748 in 1916, and is derived from the pyritic ores of the Eastern Townships and the zinc-lead ores of Notre Dame des Ange, Portneuf county.

In British Columbia the production was 2,580,521 ounces valued at \$2,100,983 as against 3,392,872 ounces valued at \$2,227,794 in 1916, showing a decrease in quantity of over 23.0 per cent. and in value of 5.7 per cent. This production includes refined silver, silver contained in smelter products and estimated recoveries from ores exported.

The Yukon production amounted to 90,772 ounces valued at \$73,904 as against 360,101 ounces valued at \$236,446 in 1916, and included the silver derived from the placer operations with also a certain amount recovered from the gold and copper ores of Whitehorse and the silver-lead ores shipped from Mayo.

The exports of silver bullion and silver in ore, etc., as reported by the Customs Department were 21,718,784 ounces valued at \$17,621,398 as against exports in 1916 of 25,279,359 ounces valued at \$15,637,885.

The monthly average price of silver varied between a minimum of 73.861 cents per ounce in March and a maximum of 100.740 cents in September, averaging for the year 81.417 cents as compared with an average of 65.661 cents in 1916.

Zinc.

During the past two years there has been a recovery of refined zinc in Canada at the zinc refinery erected by the Consolidated Mining & Smelting Company at Trail, B.C. Prior to 1916 all zinc ore mined in Canada was exported for smelting and refining. The establishment of the Trail plant has resulted in the mining and treatment of a much larger tonnage of zinc ores and a portion of the present production is still being exported for treatment.

The total recovery during 1917 in Canada of refined zinc together with the zinc contained in ores exported (less 20 per cent. allowed for smelter losses) amounted in 1917 to 31,227,351 pounds, which, at the average price of spelter in New York, 8.901 cents per pound, would have a total value of \$2,779,547. The corresponding production in 1916 was 23,364,760 pounds, valued at \$2,991,623, or an average of 12.804 cents per pound.

Quebec, in 1917, is credited with 1,161,062 pounds, and British Columbia with 30,066,289 pounds. In 1916 the Quebec production was 1,663,200 pounds and British Columbia 21,701,560 pounds.

The total zinc ore shipments from mines in 1917 were about 116,660 tons containing, without any deduction whatever 61,920,149 pounds of zinc. The total ore shipments in 1916 were 82,077 tons containing 48,498,078 pounds of zinc.

Iron Ore.

The total shipments of iron ores from Canadian mines during 1917 were 215,242 short tons valued at \$758,261, as compared with shipments of 275,176 tons valued at \$715,107, in 1916. The 1917 shipments included 198,092 tons from mines in Ontario and 17,150 tons from mines in Quebec, and of the latter amount a considerable tonnage was from old stock piles. The ores comprised 197,602 tons of hematite and roasted hematite and siderite, 12,664 tons of magnetite and 4,978 tons of titaniferous ores.

The principal operating properties were the Helen and Magpie mines of the Algoma Steel Corporation, all of the ores mined being first roasted before shipment. The Moose Mountain Company continued development and experimental work in concentration and briquetting but made only small shipments.

In Quebec shipments of ilmenite were made from Ivory-on-the-Lake in Terrebonne county and of titaniferous ore from St. Urbain on the north shore of the St. Lawrence. Shipments of magnetite were also made from stock piles at the Bristol mine in Pontiac county and a small tonnage from Ironsides, in Hull township.

In the Great Lakes area the ore prices for 1917 were: Old Range Bessemer \$5.95 per gross ton; Messabi Bessemer \$5.75; Old Range Non-Bessemer \$5.20 and Messabi Non-Bessemer \$5.05—an increase of \$1.50 over the 1916 prices. The same quotations have been continued into 1918.

Mine operators reported 169,192 tons of ore exported to the United States and 46,050 tons shipped to Canadian furnaces.

The Customs Department shows exports of iron ores 164,004 tons valued at \$660,673 and imports amounting to 2,251,397 tons valued at \$5,124,889.

The total quantity of iron ore charged to blast furnaces in 1917 was 2,176,296 tons of which 92,065 tons were of domestic origin and 2,084,231 tons imported. The imported ore included 874,134 tons of Newfoundland ore and 1,210,097 tons of "Lake ore."

Shipments of iron ore from Wabana mines, Newfoundland, in 1917 by the two Canadian companies operating there were 883,346 short tons, as against 1,012,060 tons in 1916, all of which went to Sydney and North Sydney in Cape Breton.

Pig Iron.

The production of pig iron in blast furnaces during 1917 was supplemented by a small production of high grade low phosphorous pig iron in electric furnaces made from shell turnings and other steel scrap. The total production from both sources (not including the output of spiegeleisen, or other ferro-alloys) was approximately 1,171,789 short tons (1,046,240 gross), final returns not yet having been received from all manufacturers of electric pig iron. Of the total, 1,156,789 tons were produced in blast furnaces and the balance in electric furnaces. In 1916 the production all made in blast furnaces was 1,169,257 short tons (1,043,979 long tons).

The small increase in pig iron production in 1917 was therefore due entirely to the electric furnace production, there having been an actual falling off in the

The production in Nova Scotia in 1917 was 472,147 tons as against 470,055 tons in 1916. In Ontario the production by blast furnaces in 1917 was 691,632 tons as against 699,202 tons in 1916.

By grades the 1917 production included: Basic 14,092 tons; Bessemer 961,656 tons; Foundry and malleable, etc., 181,041 tons; electric furnace pig (subject to revision), 15,000 tons. The 1916 production included: Basic 953,627 tons; Bessemer 31,388 tons; foundry and malleable, etc., 184,242 tons.

The blast furnace plants operated were the same as in the previous year, viz.: the Dominion Iron & Steel Company at Sydney, N.S., the Nova Scotia Steel & Coal Company, at North Sydney; The Standard Iron Company at Deseronto, Ont., The Steel Company of Canada, at Hamilton, Ont., The Canadian Furnace Company, at Port Colborne, Ont., and the Algoma Steel Corporation, at Sault Ste. Marie, Ont.

Pig iron was made in electric furnaces by: The Canada Cement Company, Ltd., Montreal; Fraser, Brace & Company, Ltd., Shawinigan Falls, Que.; British Forgings, Ltd., Toronto, Ont.; Electro Foundries, Ltd., Orillia, Ont., and Turnbull Electro Metals, Ltd., St. Catharines, Ont.

The total production in electric furnaces of pig iron, ferro-alloys and steel ingots and castings was in 1917 about 99,000 short tons.

The production of ferro-alloys in Canada in 1917, chiefly ferro-silicon but including also spiegeleisen, ferro-molybdenum and ferro-phosphorous, all with the exception of the spiegeleisen being made in electric furnaces, reached a total of 40,341 tons valued at \$3,408,906, as against a total in 1916 of 28,628 tons valued at \$1,777,615.

The exports during 1917 of pig iron were 12,081 tons, valued at \$423,814, or an average of \$35.08 per ton and of ferro-alloys 33,212 tons valued at \$2,616,924, or an average of \$78.79 per ton.

The imports during 1917 included 82,758 tons of pig iron valued at \$2,744,055, or an average of \$33.16 per ton; 632 tons of charcoal pig iron valued at \$19,447, or an average of \$30.77 per ton, and 12,828 tons of ferro-alloys valued at \$2,029,990, or an average of \$158.25 per ton, making a total import of pig iron and ferro-alloys of 96,218 tons valued at \$4,793,492. The United States trade records show exports to Canada during the eleven months ending November, 1917, of pig iron and ferro-alloys amounting to 130,087 gross tons (145,697 short tons) valued at \$5,170,005, a figure considerably higher than the Canadian record.

Steel.

The estimated production of steel ingots and direct steel castings in 1917, final returns for all operations not yet having been received, was 1,736,514 short tons, (1,550,459 gross tons) of which 1,690,170 tons were ingots and 46,344 tons direct steel castings.

The total production in 1916 was 1,428,249 tons compared with which the 1917 production shows an increase of 308,265 tons, or 21.6 per cent.

The total production of electric steel in 1917 was probably not less than 50,000 tons as against 19,639 tons in 1916 and 5,625 tons in 1915.

The exports of steel ingots, or billets, ingots and blooms, during the nine months ending December (such exports not being separately classified previous to April, 1917) were 41,558 tons valued at \$1,831,917. The recorded imports of iron and steel ingots and billets during the year was 20,429 tons valued at \$1,378,576. This item is also much lower than the United States trade

record which shows exports to Canada during eleven months ending December of 143,209 gross tons (160,394 short tons) of billets, ingots and blooms of steel valued at \$11,418,033.

Asbestos.

The production of asbestos continues to increase under the stimulation of war demand. The product has been marketed at much higher prices and the total sales show a substantial increase. Stocks on hand at the end of 1917 were slightly in excess of those reported at the end of 1916.

In addition to the production in the Province of Quebec which is derived from the asbestos areas at Black Lake, Thetford, Robertsonville, East Broughton and Danville, there is also included in the record of production, as given herewith, a small output of crude asbestos amounting to 10 tons valued at \$2,150 produced and shipped from the Porcupine District in the Province of Ontario. These Ontario operations have been discontinued for the present but indicate the possibilities of sources of supply other than the well known areas in Quebec.

Exports of asbestos during the calendar year 1917 were 93,932 tons, valued at \$4,903,326, or an average of \$52.20 per ton and asbestos sand and waste 52,088 tons valued at \$430,956, or an average of \$8.27 per ton. There was also an export of manufactures of asbestos valued at \$55,666.

Lieut. W. M. Goodwin, M.C.

The exports in 1916 were 96,775 tons of asbestos valued at \$3,872,463, or an average of \$40.01 per ton and asbestos sand and waste 33,564 tons valued at \$241,272, or an average of \$7.18 per ton; also manufactures of asbestos valued at \$4,741.

Chromite.

The total shipments of ores and concentrates by mine operators was 36,352 tons valued at \$490,001 containing approximately 8,626 tons, or an average of about 23.7 per cent., Cr_2O_3 . A portion of these shipments was made to the Customs mill at Lakeside, Black Lake, operated by the Mutual Chemical Company and the final shipments from the District of ores and concentrates was 23,327 short tons valued at \$572,115, and containing approximately 8,465 tons of Cr_2O_3 , or an average of 36 per cent.

Most of the concentrates shipped averaged 50 per cent. Cr_2O_3 , while a large percentage of the ore shipments averaged about 32 per cent.

The production was, as usual, obtained from the Eastern Townships of Quebec, chiefly at Black Lake and Thetford, with an important contribution from the new area at St. Cyr in the township of Cleveland, Richmond county.

The mine operators' shipments in 1916 were 27,517 tons, valued at \$311,460, and containing approximately 6,759 tons, or an average of 24.5 per cent. Cr_2O_3 .

Capt. Stuart M. Thorne.

Lieut. Isidore Duchesne Drake-Daimpre.

Of this amount, 14,242 tons were sold to a customs concentrator, and the final shipments of ores and concentrates during the year was 14,321 tons.

The exports of chromite as reported by the Customs Department were 19,229 tons valued at \$342,528 as against 12,633 tons valued at \$152,534 exported in 1916.

Coal and Coke.

Coal:—The total production of marketable coal during 1917 (comprising sales and shipments, colliery consumption and coal used in making coke or used otherwise by colliery operators) was less than the 1916 production by 467,807 tons, or 3.2 per cent. in quantity, but greater in total value by \$8,826,165, or 22.7 per cent.

Production, imports and exports and consumption during 1916 and 1917 were as follows:

	1916.		1917.	
	Short tons.	Value.	Short tons.	Value.
Production ...	14,483,395	\$38,817,481	14,015,588	\$47,643,646
Exports	2,135,359	7,099,387	1,733,156	7,387,192
Imports	17,580,603	38,289,666	20,857,460	70,562,357
Consumption ..	29,928,139	33,139,892

The exports fell off by 402,203 tons, or 18.8 per cent., the imports were increased by 3,276,857 tons, or 18.6 per cent., the apparent consumption increased by 3,211,253 tons, or 10.7 per cent.

The total output of coal, including waste and unmarketable slack was, in 1917, 14,411,011 tons, as against 14,815,703 tons in 1916.

The 1917 production included 108,225 tons of anthracite, all from one mine in Alberta; 11,135,095 tons of bituminous coal, and 2,772,268 tons of lignite coal.

The provinces of New Brunswick, Saskatchewan, Alberta, and the Yukon made greater production of coal during 1917, and with the exception of the Yukon, show the highest annual production on record. The total increases in these provinces was 284,781 tons. The total decrease in Nova Scotia and British Columbia was 752,588 tons, leaving a net decrease as already shown.

The Nova Scotia production fell off 587,456 tons, or 8.5 per cent., as compared with 1916; New Brunswick increased 45,120 tons, or 31.4 per cent.; Saskatchewan increased 74,004 tons, or 26.3 per cent.; Alberta increased 164,085 tons, or 3.6 per cent., notwithstanding the serious loss of output due to strikes; the British

Capt. George C. Riley, 6th Howitzer Brigade.
Formerly Secretary of the Montreal Branch, C.M.I.

Columbia production fell off 165,132 tons, or 6.4 per cent.; the Yukon production, though small, shows a large percentage increase.

The total imports in 1917 included 15,537,262 tons of bituminous coal, valued at \$42,452,771, or an average of \$2.72 per ton, as against 13,009,788 tons valued at \$17,073,303, or an average of \$1.24 in 1916, showing an increase in 1917 of 2,527,474 tons, or 19.4 per cent.; and 5,320,198 tons of anthracite, valued at \$28,109,586, or an average of \$5.28 per ton, as against 4,570,815 tons, valued at \$22,216,363, or an average of \$4.86 in 1916, an increase in 1917 of 749,383 tons, or 14.1 per cent.

WALLINGFORD MICA AND MINING CO.

Mr. E. Wallingford, manager of the Wallingford Mica and Mining Co., Ltd., operating mica mines at Perkins' Mills, Quebec, reports an excellent demand for mica and great activity at the company's mines. At the old Wallingford mine, a four-drill compressor was installed and over 100 tons of culled mica produced in 15 months of 1916 and 1917. Crosscutting was carried on at the same time in the old pit at 180 ft. depth to lodes, one of which is rich in very fine soft amber mica.

Development work was also carried on successfully at the Rainville, or Wallingford No. 2 mine, which is on the east half of lot 15, Range 8, North Templeton. Nine veins were found, and one of these deposits now being worked yields very large mica. Mr. Wallingford reports that one crystal, 5 ft. 4 in. in diameter, yielded over 3 tons of mica of the amber variety.

The company has about 20 men employed in the mines, and 30 to 40 cullers. Twice as many men would be used if they could be obtained. Much of the mica is used for war purposes.

Mr. W. E. Simpson, of Cobalt, has arranged to periodically visit the Kaladar district as consulting engineer for the Cobalt-Frontenac Mining Co.

Sir Boverton Redwood, Bart., Director of Petroleum Research for Great Britain, has been appointed by the Government Director of Technical Investigations, in the recently-created Petroleum Executive, with a view to his dealing with technical questions of the highest importance, including the co-ordination of the work of petroleum production and that of petroleum

Mr. Ross H. McMaster, assistant general manager of the Steel Company of Canada, has left for Washington, where he will act on the new Canadian War Mission Board, of which Lloyd Harris, of Brantford, is the chairman.

The late W. H. Brethour, who recently lost his life by being frozen when on the Atlin trail, near Carcross, was born in North Saanich, Vancouver Island, B.C., on March 31, 1879. On the outbreak of the South African war he offered his services to the country, and went with the First Canadian Contingent to the seat of hostilities, where he remained until six months after the declaration of peace.

On returning home he took up the study of mining engineering, putting himself through the University of California. His professional career started with the Douglas Island mines, in Alaska, which concern he was with until he transferred his connections to the Guggenheims, at Atlin. Three years ago he was sent to South America by a French mining company for the winter months to report on gold finds at the headwaters of the Amazon, after which he returned to the Yukon and continued work on the placer gold claims of the Company on Otter Creek, in Atlin mining division of British Columbia. After years of hard work on construction he completed his task and had just finished a successful mining season when he was so suddenly called away.

The deceased was a son of Mr. John Brethour, of Sidney, and was well known on the whole of the peninsula.

Lt. Col. J. E. Leckie, D.S.O.

Molybdenite Deposits of Quyon District, Quebec

By M. E. Wilson.

The numerous uses to which molybdenum and its compounds and alloys are now being applied, especially in the manufacture of certain special types of steel in much demand for military purposes, and the consequent high price paid in some countries, has brought about during the war a widespread search for molybdenite, the principal ore of molybdenum. As a result numerous occurrences of this mineral have been found in various parts of Canada and notably in the Ottawa Valley to the north and west of Ottawa. Of these discoveries, probably the most important is that occurring on lots 9 and 10 in the 10th Range of Onslow Township, 3 miles north of the village of Quyon. From this property approximately 300,000 lbs. (estimated) of molybdenite concentrates has been produced in less than two years' operation.

The presence of a knob of molybdenite-bearing rock in the rear of the farm buildings on the farm of Mr. Robert Steel, lot 9, Range VII, Onslow township, had been known to the inhabitants of the district for many years; but it was not until 1915 that attention was directed to the occurrence. In the autumn of that year Messrs. Arch. MacLean and Authur Latimer procured an option on the property and the following March sold their option to Messrs Harvey Fitzsimmons of Ottawa and Henry Wood of Denver, Colorado, who formed the Canadian-Woods Molybdenite Company to purchase and operate the property.

The newly organized company immediately began shipping ore to the concentrating plant of Henry Wood, in Denver, and to the ore dressing laboratory of the Department of Mines in Ottawa. A few car loads of ore were also shipped to the plant of the International Molybdenite Company at Renfrew, Ontario. Later, in 1916, a mill having a capacity of approximately 50 tons per day was built on the property and a second concentrating plant was secured by installing Wood's flotation machines in the plant of the Canada Cement Company at Hull, Quebec.

Early in 1917 Mr. C. A. Foster, of Haileybury, Ont., procured an option on the mine from the Canadian-Woods Molybdenite Company and later purchased the property on behalf of an American syndicate operating under the title Dominion Molybdenite Company. During the summer of 1917 this company car-

ried on extensive diamond drilling operations to determine the extent of the deposits and enlarged the capacity of the mill to 200 tons per day. In the new mill, the Callow system of concentration was installed in place of the Wood flotation machines.

Geological Relationships of Quyon Molybdenite Deposits.

The Quyon district lies on the southern border of the Laurentian highlands, which occupy the greater part of north eastern Canada, and in common with the greater part of this great upland is underlain, for the most part, by those ancient Pre-Cambrian formations which, because of their highly deformed or otherwise metamorphosed condition are commonly grouped together as the "basal complex." The detailed succession of formations within this complex as represented in eastern Ontario and the southern Laurentians of Quebec has not yet been completely worked out; but the results of investigations in scattered localities seem to indicate that four principal groups of rock are represented as follows: (1) A group of recrystallized marine sediments known as the Grenville series. (2) A group of igneous pyroxenic rocks, gabbro, anorthosite, pyroxene, syenite, etc., intrusive into the Grenville series. (3) Batholithic masses of granite and syenite intrusive into the rocks of groups 1 and 2, and (4) Masses of diopside, scapolite and other lime-silicate minerals (pyroxenite), formed by the contact action of rocks of groups 2 and 3 on the limestone member of the Grenville series. It is the third of these groups that is of special interest in this connection since it is with these rocks that the Quyon molybdenite deposits are associated.

In the region northwest of Ottawa the border of the Laurentian highlands is marked by a steep, rocky, northwesterly trending escarpment, several hundred feet in height, which rises in striking contrast with the flat, clay-covered lowland to the southward. This remarkable topographic feature parallels the north shore of the Ottawa River as far as the western part of the township of Onslow, where it terminates abruptly, giving place to the more characteristic, poorly defined highland border consisting of rocky knobs protruding through clay flats.

At the western termination of this escarpment in the 7th Range of Onslow township a stock-like mass of fine, pink quartz-syenite, in which numerous masses of an older coarse porphyritic syenite are included, is exposed throughout an area approximately one mile wide from north to south and two miles long from east to west. The larger part of this mass lies in the upland above the escarpment; but two outliers outcrop in the lowland below. Within this pink syenite and in the adjacent intruded rocks, molybdenite occurs in thin seams, in small aggregates and disseminated in masses of siliceous, pyritic rock which have apparently segregated from the syenite. Five deposits of this segregated type in all have been discovered: three in a low ridge protruding through a sandy, wooded flat at the north end of lots 9 and 10, Range VII, Onslow, and two on the slope of the main syenite mass which forms a part of the Laurentian escarpment, a few hundred yards to the northeastward. Most of these

Main Pit, Dominion Molybdenite Mine, July, 1917.

Concentrating Mill, Dominion Molybdenite Co., Quyon, Quebec.

occurrences are too limited in extent to be of commercial importance. It is the main segregated mass, outcropping in the low eastward tending ridge at the south end of lots 9 and 10, from which most of the molybdenite produced from the property of the Dominion Molybdenite Company has been mined.

Character of the Quyon Molybdenite Deposits.

The molybdenite deposits of the segregated type are irregular, poorly-defined masses, generally elongated in a north-northeasterly direction. They are known as deposits number 1 to 5 in the order of their importance. The number 1 deposit is exposed on the faces and bottom of the number 1 pit, and is approximately 50 ft. wide and 200 ft. long. The number 2 deposit outcrops on the hill slope at the north end of lot 9 and is approximately 150 ft. long and from 5 to 25 ft. wide. Deposits number 3 and 4 are smaller masses, 15 and 4 ft. in width respectively, outcropping on lot 9 to the northwest of the main pit. Deposit number 5 is a small, irregular mass 10 ft. in diameter exposed near the bottom of the Laurentian escarpment on lot 11, Range VII, in Onslow township.

The ore consists for the most part of granular quartz and feldspar—chiefly microcline—in which pyrite, pyrrhotite, fluorite and molybdenite occur, partly in disseminated form and partly in aggregates up to several feet in diameter. In places within the deposits, crystals of a dark green pyroxene, some of which are radially disposed, are abundantly developed. At a few points coarse aggregates of a black biotite were observed. Where masses of pyrite occur in the rock, the pyrite cubes very commonly assume a peculiar net-like distribution, the interspaces of the net being filled with quartz, magnetite and limonite. The molybdenite and other sulphides disseminated in the lean ore are very commonly distributed in linear zones parallel to the longer direction of the deposit so that the rock exhibits a banded structure. It is obvious that the proportion of molybdenite in deposits of such irregularity varies greatly in different parts of each ore mass and that it is not possible to definitely estimate the percentage of molybdenite contained in an orebody from the proportions recovered from the parts of the deposit already mined. It is probable, however, that at the time the writer made his examination of the deposits, the average molybdenite content of the ore exposed on the bottom of the No. 1 pit did not exceed three-quarters of one per cent., and that the average contained in the exposed surface of the No. 2 deposit was probably less than one-half per cent.

Origin of Quyon Molybdenite Deposits.

It has been suggested* that the Quyon molybdenite

deposits possibly represent metamorphosed and mineralized blocks of Grenville limestone included in the Onslow syenite mass, an hypothesis that might be inferred from the presence of pyroxene and fluorite, two common mineral constituents of contact metamorphic deposits. However, the pyroxene contained in the molybdenite deposits is an iron-magnesium variety such as commonly occurs in igneous rocks and not the lime variety common in metamorphic deposits. Furthermore, since the feldspar present is largely microcline, it is probable that the lime content of the molybdenite ore deposits, taken as a whole, is limited largely to the fluorite and is not greatly in excess of that contained in most igneous rocks of the syenite class. On the other hand, the similarity in the mineralogical composition of the ore rock to the quartz syenite enclosing the deposits; the complete gradations from the quartz syenite into ore rock which occur everywhere along the margins of the ore deposits; and the presence of small aggregates of quartz, fluorite and molybdenite—miniature ore deposits—at numerous points within the syenite, would seem to indicate that the material contained in the ore deposits had originally formed a part of the syenite mass and had segregated together into the ore masses.

Why the material aggregates composing the ore deposits accumulated at certain points is not at all apparent. The syenitic wall rock of most of the deposits contains inclusions of the older porphyritic syenite, and it is possible that the presence of these masses may have been a factor in the precipitation of the ore material; but inclusions of the older syenite are so common in the Onslow mass that it is also possible that their association with the ore deposits is wholly accidental. The ridge in which the main orebody is situated at its western end is composed of the pink quartz syenite. At its eastern end, on the other

Diamond drills in operation on Dominion Molybdenite property

hand, it consists of the older porphyritic syenite cut by dikes of the quartz-syenite, so that the orebody in reality lies on the margin of the area of continuous syenite exposed in the western part of the ridge and what might represent a marginal segregation from this mass. The border of this area of continuous syenite in other directions, however, is buried beneath the sandy flat surrounding the ridge, and whether or not similar relationships hold at other points on the border of the mass cannot be determined. As far as the writer was able to observe, therefore, all that can be concluded with regard to the factors determining the development of the ore masses at certain points is that it is possible that in part, at least, their development was controlled by the contact relationships of the Onslow syenite with the older porphyritic syenite which it intrudes.

SHAWINIGAN COMPANIES HAVE SUCCESSFUL YEAR.

The rapid development of the Shawinigan Water and Power Company is again demonstrated by the report for the year ending December last, presented to shareholders at the annual meeting. Gross earnings for the year amounted to \$2,902,210, compared with \$2,325,872 for 1916, an increase of \$576,338, or 25 per cent. Operating expenses, maintenance, and taxes amounted to \$752,842, leaving \$2,149,367, from which was deducted fixed charges totalling \$698,503, and depreciation reserve of \$100,000, leaving the net profits for the year at \$1,350,864.

President J. E. Aldred, in his report, said in part:

"A new works has been constructed at Shawinigan Falls by the Canadian Aloxite Company, Limited, a subsidiary of the Carborundum Company of America. This plant will require about 12,000 horse-power, will employ a large number of hands, and is an important addition to the industries at Shawinigan Falls. The works are now substantially completed, and the installation of equipment is going on. It is expected that within a short time the plant will be in full operation.

"The Canada Carbide Company has enjoyed the best year in its existence, not only in respect of output, but also as regards the financial result. In spite of the largely increased cost of manufacture, due to the increased cost of raw materials, the company has been able to attain satisfactory results. Its output is now at the highest point in the history of the company, and it is anticipated that the next year will prove to be even more successful than 1917.

"Closely allied with the Canada Carbide Company, is the Canadian Electrode Company, which manufactures carbon electrodes, largely for use in the Carbide furnaces. This plant has proved to be an important factor in the operation at Shawinigan, and has in its turn made a satisfactory result, not only in output of product, but in profit on that product. The Canadian Electro Products Company is also now operating on a satisfactory basis. Various accidents and delays occurred in attaining results, and for some time the plant was operating under serious handicaps. A new contract, however, has been made with the Imperial Munitions Board, extending the operation of the plant throughout 1918. This contract has been made under such terms and conditions that the results will prove very advantageous to the company.

"There has developed, during the past year, a situa-

especially favorable to all water-power enterprises. The coal situation in the United States has become uncertain; large industries are shut down for want of coal; public service enterprises driven by steam, have been obliged to reduce their output on account of the scarcity of coal. It is obvious that the effect of this condition will be lasting and manufacturers using electricity will so far as possible prefer to obtain it from reliable waterpowers. In general, it may be stated as regards hydro-electric development, that time is on its side, and the future cannot fail to be advantageous to it.

"The policy of your company has been to develop industries in the Province of Quebec, and particularly in the valley of the St. Maurice River, looking forward to intense industrial activity in this section of the country, based on the favorable natural conditions which exist in this section.

"While a great amount of power is being used in the manufacture of chemicals, aluminum and other commodities now being used for war purposes, it should be noted that in almost every instance these works were in full operation previous to the war, and will doubtless be in full operation after the war as well."

Mr. J. G. Dickenson, general manager of the O'Brien Mine, Cobalt, and the Miller Lake-O'Brien Mine, Gowganda, has returned to Cobalt after a six weeks' trip of inspection of the O'Brien Company's properties in Arizona, California and New Mexico.

Mr. C. J. Girvin, of Denver, Colorado, was in Toronto last week, and is now visiting Northern Ontario mining districts.

Major Neil R. Macdonald (by his intimates and friends affectionately termed "Fog-horn"), of the "Black Devils."

The Magnesite Industry of Quebec

By Howells Frechette, M.Sc.

In the table of output of twenty-three products of the mines of Quebec, magnesite occupied, in 1913, the 21st place in order of value. In 1916 it had risen to the 5th place. In 1913, only 515 tons, valued at \$3,335, was produced, while in 1916, 53,976 tons was produced, valued at \$525,966.*

This immense increase of production is directly attributable to the war. In 1913, the United States produced less than 10,000 tons of crude magnesite, while importing crude and calcined magnesite equivalent to about 350,000 tons of the crude mineral. Owing to blockade, embargo and scarcity of bottoms, the importation from Europe was greatly curtailed. There was a serious shortage resulting in the employment of substitutes for magnesite, where possible, and also in greatly increased production of this mineral in the Western States of the Union and in Canada.

In Western Canada fairly large deposits of hydro-magnesite occur widely distributed. Most of these are distant from railroads and markets. One deposit at Atlin was worked to a very limited extent within the past three years.

Character of Magnesite Mined in Quebec.

Quebec possesses the only known workable deposits of magnesite in Eastern Canada. These are situated in Argenteuil county, about midway between Ottawa and Montreal, to the north of the Ottawa River. They occur in the Grenville series of the Archean formation. The magnesite is very similar in appearance to the crystalline limestone of this series, being coarsely crystalline and usually white, though sometimes blueish grey or yellowish. The magnesite rock forming the deposits is composed essentially of the mineral magnesite (magnesium carbonate). Dolomite (lime-magnesium carbonate) is the principal accessory mineral, being practically always present, sometimes constituting a large proportion of the rock. Serpentine, diopside and other minerals are frequently found disseminated, generally in small quantity, through sections of the deposits.

The following analyses will serve to illustrate the general composition of the magnesite rock:

Insoluble mineral matter	2.20	3.08	2.00	2.00	.74
Iron Oxide	.13	.29	.57	.50	.24
Alumina	.03	.35	1.47	.80	.36
Lime	8.80	10.06	5.80	6.95	10.05
Magnesia	39.12	37.76	41.34	40.76	38.52
Carbon dioxide	49.72‡	49.39†	49.66†	49.88†	49.86†

‡By difference.

†Calculated.

The insoluble siliceous matter, the iron and the alumina are usually low in percentage. The lime, even in selected samples, is seldom below six per cent.

According to Dr. M. E. Wilson,§ these deposits are associated with the metamorphosed group of sediments, crystalline limestone, garnet gneiss, and quartzite, composing the Grenville series, and in three localities the magnesite is found in close proximity to outcrops of the pyroxenic rocks of the Buckingham series. It is probable that these deposits were formed by the replacement of the lime by magnesia in crystalline limestone, the transformation being first to dolomite and finally to magnesite.

North American Magnesite Company.

The principal operators are the North American Magnesite Co., Ltd., and the Scottish-Canadian Magnesite Co., Ltd. Messrs. Fitzsimons, Boshart and Inglee have also made some shipments.

The North American Magnesite Company owns and operates quarries on lot 15, range IX, and lot 18, range XI, Grenville township, and operates under lease, a quarry on the north end of lot 13, range I, Harrington township. From all these quarries crude magnesite is shipped. Hauling to the railway at Calumet is done by wagons or sleighs, the distances from the various quarries ranging from nine to sixteen miles.

Caustic Magnesia and Dead Burned Magnesite.

At the quarries on lot 15, range IX, some of the magnesite is calcined in a Keystone lime kiln and shipped as caustic magnesia. The company also produces dead burned magnesite at Longue Pointe, near Montreal. The burning is accomplished in one of the rotary cement kilns of the Canada Cement Co., Ltd.

Scottish-Canadian Magnesite Company.

The Scottish-Canadian Magnesite Company owns and operates quarries on lot 15, range X, and lot 15, range XI, Grenville township. The crude magnesite is transported to Grenville, a distance of fourteen miles, over a narrow gauge railway. Dead burned magnesite is produced by this company at the plant of the Canada Cement Co., at Hull.

Magnesite Available.

Dr. Wilson, in his report already referred to, makes the following summarized statement of the number of tons of magnesite and magnesite-dolomite in sight in the various properties referred to above.*

Property.	Magnesite containing less than 12 per cent. CaO tons.	Magnesite-dolomite containing more than 12 per cent. CaO tons.
Lot 13, range I, Harrington Tp.	25,000	8,000
Lot 18, range XI, Grenville Tp..	15,000	6,000
Lot 15, range XI, Grenville Tp..	418,000	186,300
Lot 15, range X, Grenville Tp...	2,500	4,000
Lot 15, range IX, Grenville Tp...	226,400	279,400
Total	686,900	483,700

§ "Magnesite Deposits of Grenville District, Argenteuil County, Quebec." Memoir 98, Geological Survey, Department of Mines.

* It must be noted in this connection that these estimates have no definite relationship to the amount of magnesite present on the various properties since some deposits have been more extensively developed by diamond drilling and other development.

* According to the Preliminary Report on the Mineral Production of Canada, issued by the Mines Branch, Ottawa, the production of magnesite in the Province of Quebec during 1917 was 58,090 tons of crude, caustic calcined and dead burned, valued at \$728,275.

Method of Mining Magnesite.

Quarrying is carried out by open cast methods, the rock being broken down by blasting and sledging to "one man size." In working the quarries endeavor is made to avoid those parts of the deposits in which the lime content runs high. The quarried material is cobbled to free it from excessive amounts of serpentine and highly dolomitic rock.

Magnesite and Its Products.

The magnesite is placed on the market in three forms: 1. Crude magnesite. 2. Light burned magnesite or caustic magnesia; and 3. Dead burned magnesite.

1. **Crude magnesite** is the hand-picked product of the quarry. It is shipped in lumps weighing 100 pounds or less.

2. **Caustic magnesia or light burned magnesite** is produced by calcining the crude rock in a retort or shaft kiln at a temperature of about 1100°C. The carbon dioxide is not completely driven off, about 2 or 3 per cent. remaining. It is shipped in lump form or pulverized.

3. **Dead burned magnesite** is that from which practically all of the carbon dioxide has been expelled by calcining at a very high temperature. For the uses to which dead burned magnesite is put, it is desirable that it be fully shrunk, or in other words, in as dense a form as possible. The shrinkage is due to incipient fusion, or sintering. Since the Grenville magnesite contains such small quantities of fluxing impurities, it is practically impossible to shrink it without the previous addition of some other material. The practice at Hull and at Longue Pointe is as follows:

Method of Burning Magnesite.

Crushed magnesite, mixed with approximately five per cent. of its weight of oxide of iron, in the form of magnetite, is ground in a ball mill to a fineness of "100 mesh size." This finely ground and intimately mixed material is fed at a uniform rate into the rotary cement kiln, through which it passes in counter direction to the flames. During its passage through the kiln, which requires in the neighborhood of three-quarters of an hour, the magnesite yields its carbon dioxide and the residual magnesia combines with the oxide of iron. The result is the magnesia is rendered somewhat less refractory and, when subjected to the intense heat near the firing end of the kiln, the small particles soften slightly, shrink in bulk and develop a tendency to agglomerate. Small balls, averaging half an inch in diameter, are formed as the material is tumbled along its course through the rotating kiln. From the kiln they fall into a bucket conveyor which delivers them to the shipping shed.

Uses of Magnesite.

The great bulk of magnesite consumed is used either in the caustic or dead burned state, the calcining being done by the mining companies or by firms making a business of preparing refractory materials for the market.

The crude rock is used in the preparation of various magnesian chemicals, such as Epsom salt and magnesium chloride. It is used for the production of the metal magnesium by the electrolytic process. It is also employed in the manufacturing of wood pulp by the sulphite process. The magnesite may be used in the calcined form for the foregoing purposes.

When finely ground caustic magnesia is mixed with a solution of magnesium chloride, it forms a cement

known as Sorel, or oxychloride cement, which sets rapidly. This property has found for it a very extensive use as a flooring material.

The dead burned magnesite is used exclusively as a refractory material, especially for linings for open hearth steel furnaces and for electric and other furnaces where a very high temperature is employed. These linings may be prepared in place by building up layer upon layer of magnesite to which some bonding material has been added and subjecting it, during the procedure, to high temperature, or the magnesite may first be made up in the form of bricks and built into place in the usual manner.

During 1917 the price of crude magnesite averaged between \$10.50 and \$11.00 f.o.b. Calumet, Quebec, the caustic magnesia \$25 and the dead burned magnesite as high as \$40 per ton.

KILLED IN ACTION.

Six members of the Canadian Mining Institute were killed in action during the past year: Lieut. C. St. G. Campbell, J. S. Fleming, Capt. G. G. Gibbins, Col. T. C. Irving, Lieut. O. E. LeRoy, and Lieut. C. P. McDougall.

In this issue appear reproductions of a number of photographs of members of the Canadian Mining Institute, who are serving, or have served, at the front. We publish these by courtesy of the Institute. We will be pleased to receive, for publication, photographs of members who have joined the colors. About 125 members of the Institute are now on military service.

Lieut. C. St. G. Campbell, R.F.C., who has been reported missing since April 6th, 1917.

Mineral Production and Mines

Value of the Annual Mineral Production of the Province of Quebec for past years:

Years.	Value.
1900	\$ 2,546,076
1904	3,023,568
1908	5,458,998
1912	11,187,110
1916	13,287,024

The growth of the mineral industry of the Province, as indicated by the growth in the value of the production is remarkable, and yet it is insignificant compared to the potentialities and possibilities of our resources.

Quebec **Asbestos** mines produce over 80 per cent. of the world's supply of this substance.

Quebec **cupriferous pyrite** mines have been producing continuously for forty years, and one of them is 4,000 feet deep.

Quebec **Molybdenite** production is now on a solid basis, and one of the mines is the largest individual producer in the world.

Quebec **Amber mica** takes "first rank" for electrical machinery. It is the strongest, the most elastic and the best isolator.

Quebec **Magnesite** production has grown from 515 tons, valued at \$3,335 in 1913, to 65,000 tons, valued at \$725,000 in 1917.

Quebec **Metallurgical Industry** includes one of the world's large reduction works of **Aluminum**; a manufacture of **magnesium metal**; numerous steel furnaces, both electric and fuel.

Address all inquiries for technical and statistical information to,

HON. HONORÉ MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES,
QUEBEC.

Molybdenite from Quebec

The Province of Quebec holds a prominent position as a producer of molybdenite. This is the source of the metal molybdenum, which is in great demand for the manufacture of war material. It imparts to steel special qualities of hardness and toughness, making it very resistant. Molybdenum steel is used extensively in the manufacture of large gun and rifle barrels. Moreover, molybdenum imparts to steel the quality of retaining its temper when heated to a redness, which enables it to be used for high speed cutting tools. This has revolutionized machine-shop practice, for whereas with ordinary crucible tool steel the

Molybdenite mining in Quebec first assumed importance in 1916 when ore yielding 129,275 lb. molybdenum sulphide was produced. Nearly all of this molybdenite came from the Moss mine at Quyon, near Ottawa. The property, which is in Onslow township, had been long known to contain molybdenite; but it was not until March 1916 that any development work was undertaken. A few weeks later a carload of ore was shipped to Denver, Colorado, to be concentrated in the plant of Henry E. Wood & Co. During 1916 several shipments were made to Denver and to the ore dressing laboratories of the Mines Department at Ottawa and to the

A MOLYBDENITE CRYSTAL FROM QUEBEC

average speed of cutting is from 30 to 40 feet a minute; high speed steel tools can cut 500 feet.

In 1917, the Province of Quebec produced over 70 tons of molybdenite. Several deposits are being worked in the region north-west of Ottawa, and at one of these, the Moss Mine, at Quyon, operated by the Dominion Molybdenite Company, a very complete concentrator has been installed. This mill is now treating 150 tons a day, by wet crushing and Callow cells. This process, after a period of experimentation, has given extremely satisfactory results, and it is claimed that a practically complete extraction of the molybdenite contents has been obtained. A large tonnage of ore has been blocked out by systematic diamond drilling, and the Moss mine deposit appears to be one of the most important molybdenite mines in the world.

Other important deposits, on which much exploration and development work was done in 1917, occur in the townships of Onslow, Huddersfield, Egan, Aldfield, Preissac, La Corne. In the course of the year 1918, several new producers will probably be added to the present ones. The Province of Quebec bids fair to become the world's most important producer of molybdenite.

concentrating plant of the International Molybdenum Company at Renfrew. The property was operated for some time by the Canadian-Wood Molybdenite Co. During 1917 a new company, the Dominion Molybdenite company, took over the property and is now operating the mine and has installed a concentrating plant. Mr. Clement A. Foster is manager for the new company, and Mr. M. W. Hotekin is assistant manager.

The Moss mine is about three miles from Quyon, a station on the Waltham Branch of the C.P.R., 33 miles from Ottawa.

Mr. Thos. Denis, Superintendent of Mines of Quebec, says of the ore. "The molybdenite is found disseminated in the rock in small flakes and powder. The dissemination is irregular, but very persistent, varying from a lean ore of one-tenth of one per cent., to highly concentrated nests or pockets running twenty per cent. or more in molybdenite." It is said that exploration by drilling indicates a very large body of ore that will average seven-tenths of one per cent. molybdenite.

There is much pyrrhotite and pyrite with the ore; but fortunately there is very little mica.

The molybdenite produced in Canada during the past two years has nearly all been taken by the Imperial Munitions Board at a price fixed in England. Recently the embargo on molybdenite has been removed and it should now be possible to export considerable quantities of molybdenite or ferro-molybdenum to the United States. Our exports to England have been largely in the form of ferro-molybdenum, this alloy being manufactured at Orillia and Belleville.

At a meeting of the New York section of the American Institute of Mining Engineers held on Sept. 27, 1917, the following comments on molybdenum were

employed in small quantities by the electrical and scientific instrument trades. Its salts figure as chemical reagents, pottery colorants and medicines. A salt of molybdenum is used as an explosive preservative.

"It is hoped that the war will prove to the steel workers the valuable properties of the metal, and by creating a demand for it, develop dependable sources and stabilize the supply. Tungsten, its chief competitor, has in the past enjoyed the advantage of a much better established production.

"The position of being the chief molybdenum producer has changed with remarkable frequency recently.

MOLYBDENITE ORE FROM MOSS MINE, QUYON, QUEBEC. DOMINION MOLYBDENITE CO.

presented in a paper prepared by S. H. Ball and published in a recent bulletin of the A. I. M. E.

"Molybdenum, perhaps more than any other metal, has had its production increased by the war. The 1916 production was in tonnage over twenty times, and in value perhaps 100 times, that of 1902. Its use for munitions prior to the war is shown by the fact that the principal consumers prior to 1914 were Krupp and Creusot. The 3 or 4 per cent. of molybdenum used by the Germans in their heavy artillery, and even in rifle barrels, notably prolongs the life of these weapons.

"The most important use of molybdenum in peace time is in steel and other alloys. Its consumption in tool steel appears to be at a standstill, but many feel that in this field the metal has not as yet had its final trial. The use of alloys containing molybdenum in automobile parts is increasing. The metal is also em-

In 1910 Queensland accounted for 50 per cent. of the production, New South Wales and Norway each almost 25 per cent., and Sweden and the United States produced small amounts. Active prospecting, fostered by war prices, caused the United States to take the lead in 1915, but this year Canada is apparently the most important producer. According to Mr. F. L. Hess, the world's 1915 production was equivalent to 222.6 tons of metal."

The Canadian Government has decided to license, until further notice, the free export of molybdenum, tungsten, their ores, concentrates and products to approved consignees in the United States and France. It is necessary for exporter to obtain license from Commission of Customs, Ottawa, previous to shipment and from the Bureau of Imports, War Trade Board, Bond Bldg., Washington, a license to import into the United States.

Mineral Lands

Area of the Province..... 703,653 Square Miles
Crown Lands open to Prospection 650,000 “ “
All Lands Patented for Farming since 1880 are also open.

Each prospector can stake **200 acres** of mining lands in claims of 40 acres.

Terms of Quebec Mining Law are very favorable to the prospector.

Of the 703,653 square miles of the area of the Province, over 600,000 are underlain by Pre-Cambrian rocks.

It is in Pre-Cambrian rocks that occur the Silver deposits of Cobalt; the Gold deposits of Porcupine; the Nickel ores of Sudbury; the Copper ores of Bruce mines; the Iron ores of Lake Superior, and the Province of Quebec possesses 600,000 square miles of such rocks awaiting the prospector to reveal their riches.

Copies of Mining Laws, “Information for Prospectors”; Reports of the Mines Branch, and reports on economic geology of many regions may be obtained from the Department, as well as technical and administrative information.

Address all inquiries and requests for reports to,

HON. HONORÉ MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES,
QUEBEC.

ASBESTOS CORPORATION IN 1917.

Mr. W. G. Ross, president of the Asbestos Corporation of Canada, says of operations during 1917:

Under the adverse conditions that our company had to operate during the last twelve months, the results may be considered satisfactory. The statement of Profit and Loss for the year shows a net surplus of \$253,789, as compared with \$215,476 for the previous year, an increase of \$38,313, after making provision for the Income Tax, Renewals and Betterments, and Interest on Bonds.

In order to cope with the demand for raw asbestos, which, for the time being, continues to grow, we decided to open the East Broughton property, known as the Fraser mine. This necessitated the erection of a mill. As the old Dominion mill at Black Lake had not been operated for some years, owing to the fact that centralization of operations at Black Lake had resulted in all rock quarried being milled at the British-Canadian mills, and as the erection of a new building would have been very expensive, in view of the present high cost of building materials, it was decided to move the Dominion mill from Black Lake to East Broughton. This has now been accomplished. Due to delays in getting the necessary electrical equipment, motors, etc. (these being only delivered late in the year), it was not possible to obtain any results this year. This mill, however, is now completed, and the development of the mine is now being proceeded with.

Our Kings, Beaver and British-Canadian properties were operating throughout the year to the fullest extent commensurate with labor at the company's disposal. Due to want of men, it was not possible to

operate double shifts at all the properties. Had they been available, the output would have been larger.

The demand for our products continues excellent. Given more reasonable weather and working conditions during 1918, better results may be expected, provided always that transportation facilities do not grow worse. The shortage of cars, during the last months of the year, seriously affected our company's business.

The company subscribed for and was allotted a further \$200,000 of the Dominion of Canada Victory Loan Bonds, and purchased \$190,500 of the company's own bonds at market prices.

Quarterly dividends at the rate of four per cent. per annum, on the preferred stock, involving \$160,000, were declared and paid during the year.

THE LEAD ORE SMELTING SITUATION.

By E. Jacobs.

In both British Columbia and the State of Idaho there is trouble and dissatisfaction in regard to the charges and actions of operators of lead ore smelting works, and in both countries the combined action of mine-owners is urged with the object of securing government regulation of smelting works. The grounds on which government control is urged, though, are entirely different as regards Idaho from those on which strong complaint is made in the West Kootenay district of British Columbia.

Last year the Bunker Hill Mining and Concentrating Co., operating in the Coeur d'Alene district of Idaho, commenced smelting at its own newly established smelting works certain of its own ores of a grade it claims its contract with the American Smelting and Mining Co. does not compel it to ship to that company's smelting works. The A. S. and R. Co. brought an injunction suit with the result that a judge of the United States Court has granted a preliminary interlocutory order requiring delivery to the A. S. and R. Co. of the "normal" product of the Bunker Hill and Sullivan mines, pending trial of a suit to determine what goods of ore are "normal" product and so covered by that contract.

Following other editorial comment on the subject, Northwest Mining Truth, of Spokane, observes: "Mining Truth has reiterated the seriousness of the situation for more than two years and hopes that at some not too remote date the mining interests of this section will awake to the grave danger that threatens. It seems patent to us that the only efficacious manner in which the rapacity of the Trust can be finally curbed is by government regulation of smelters. That they are public necessities goes without saying and we believe the country is now in mood to take up the miners' demands to good purpose. Mining Truth will, therefore, commence a campaign to that end with its next issue, and will introduce the first resolution on the subject at the forthcoming Northwest Mining convention in this city. We ask the earnest attention of all mining men and their active support if our presentation of the subject meets with approval."

The stated reason for advocating Government control in Canada is stated by The Kootenayan, of Kaslo, West Kootenay, to be an increase in the "flat rate" for smelting, to be charged by the Consolidated Mining and Smelting Co., Trail, of \$5 a ton, with sundry deductions additional to those heretofore made. The Kootenayan reflects strongly on the Consolidated Company in this connection and urges government action.

The late Lieut. C. H. McDougall, killed in action early in

The Position of the Dominion Coal Co. in Nova Scotia

By F. W. Gray.

The "Halifax Herald" is, by way of being a general, not to say an impartial, iconoclast, and in connection with the mooted merger of the interests of the Dominion Steel Corporation with those of the Nova Scotia Steel and Coal Co., it has once more trotted out the hackneyed accusation that when the Nova Scotia Legislature put the seal of its approval on the incorporation of the Dominion Coal Company, and granted a 99 years' lease of the consolidated coal areas, that it bartered away the rights of the people of Nova Scotia for "the mess of pottage of 12½ cents royalty" and created a monopoly which has acted in restraint of trade and against the public interest.

What are the facts? When the Dominion Coal Company was incorporated, in 1893, the coal production of Nova Scotia was about 2,000,000 tons per annum, and the Dominion Coal Company itself contributed 800,000 tons to this total. In 1913, when the peak of coal production was reached in the province, the total production had risen to 7,263,000 tons, of which total the Dominion Coal Company contributed 4,739,000 tons, or 65 per cent.—not counting the output from the Springhill Collieries. At the time when incorporation was granted, the Dominion Coal Company undertook to pay for the privilege of the 99 years' lease a royalty of 12½ cents per ton, whereas all other operators paid 10 cents per ton, with an undertaking that the Government would receive a minimum annual royalty not less in amount than the total royalty monies collected from all the independent companies operating the consolidated areas in the year preceding amalgamation. If this limiting clause is to be taken as any indication of the extent of the future hopes of those who framed it, it must be admitted that their expectations were more than realized, for year by year the coal production of the Dominion Coal Company increased until the outputs of the years preceding 1893 have become merely a memory.

In the 20 years from 1893 to the end of 1912 inclusive, the Dominion Coal Company mined approximately 50,000,000 tons of coal, on which it paid 12½ cents per ton royalty. In the same period all the other operators put together mined approximately 35,000,000 tons of coal, on which they paid 10 cents per ton royalty. From the 1st of January, 1913, the Government imposed a royalty of 12½ cents per ton on all coal mined in the province. From the standpoint of the Government it would appear that the bargain with the Dominion Coal Company was justified by the results.

As to the effect of the Dominion Coal Company's operations on the people of the province, it may be confidently stated that if this large company had not been formed, and if coal-mining operations had been continued in the intermittent and detached manner which preceded the formation of the company, the production of coal would to-day be much smaller, the selling price per ton would be much higher, and the value of the mining areas would be infinitely less.

Several years ago the writer expressed the following conclusions*, which are now quoted as being written at a time when the consolidation of the Dominion and Scotia interests was not being talked of, and can there-

fore be regarded as being uninfluenced by any other considerations than those which relate to the beneficial effects of so-called "monopolies" as they have been exemplified in the history of the coal trade in Nova Scotia.

Generally reviewing the economics of the industry, the writer stated:

"From the standpoint of the investor, the operation of coal mines in Nova Scotia in the past has not been encouraging. Some of the coal companies, during prosperous times, and in the earlier and less expensive operation of their collieries, paid regular and handsome dividends over many years.

"In very few instances, however, in the history of coal mining companies in Nova Scotia has there been any likelihood of a redemption of the original capital outlay, and a very moderate interest return is all the investor has been able to hope for. The majority of the companies now operating have been compelled to undergo financial reorganization. Several companies have suffered complete financial disaster, in some cases brought about by physical conditions beyond control, and in other cases by unskilled management, or the unjustifiable optimism of promoters.

"Generally speaking, however, the mines of Nova Scotia have been well managed from an engineering point of view, and the meagre financial return in the past has been due to alterations in the fiscal policies of Canada and the United States, resulting in temporary disorganization of markets, to the remoteness of the principal markets, the interference, or stoppage, of coast-wise shipments by ice in the winter, and the comparatively low selling price of coal in Eastern Canada.

"Within the past twenty years the price of coal has varied very little, it being one of the few commodities that has not materially increased in selling value.

"It is doubtful whether the market for Nova Scotian coal has ever yielded the operators a greater price than \$2.50 per ton at the pit mouth, and the average price realized, after allowing for waste and slack coal, is very much less than this figure. A comparison with normal European pit mouth selling prices will show how moderate this figure is, if due consideration is accorded to the higher cost of labor and materials in Canada.

"The margin of profit has been too small to permit of the accumulation of proper reserves to provide against the troubles inseparable from mining coal, or to allow of adequate depreciation reserves for the amortization of capital liabilities and the depletion of coal areas. Therefore, periods of financial depression or mining accidents have too often forced the abandonment of mining operations and have involved investors in losses.

"The formation of the Dominion Coal Company was an evolution from these conditions, and whether it be a retrograde tendency or not, the logic of events has indicated the chief hope of settled prosperity in the Nova Scotian coal trade to lie in the further development of strong corporations, with adequate financial reserves. There is no reason to anticipate anything but a long and successful career for the coal companies of the province if these essential qualifications are given the consideration they deserve.

"Whatever financial stability attaches to the coal companies of Nova Scotia to-day, is a testamentary benefit conferred by the General Mining Association.

sible to conceive mining operations on a comprehensive basis, eliminated suicidal competition in selling prices, and enabled mine workings to be laid out with the maximum of economy, with due regard to the conservation of the vast coal reserves which sporadic individual operations have tended to endanger by uncoordinated effort.

"The price of coal in Eastern Canada has always been dependent on the selling price in the United States, but it is candidly admitted, to-day, that coal has in the past been mined in the United States, and sold there and in Canada, at a price actually below the cost of production, when all the factors of that cost are taken into consideration."

That the "chief hope of settled prosperity in the Nova Scotian coal trade lies in the further development of strong corporations with adequate financial reserves" was never so apparent as it is to-day. The coal industry of the province is to-day in a period of recession. It has entered that phase of coal mining economics when the first pickings have become exhausted; when the thicker seams, and the easily accessible areas have practically disappeared; an era of rising costs of extraction, of increasing cost of wages and materials has commenced. The future of the coal industry of the province lies chiefly in the submarine areas, and the winning of these will call for large plans, for long views, for the expenditure of immense sums of money with the knowledge that such capital expenditure can only be recouped over long periods of time. Engineering plans will be required years in advance of their consummation, and some of the most far-reaching and fascinating projects of the mining engineer may see fruition off the shores of Cape Breton Island.

Operations conceived on the necessary scale are, however, only possible to large companies having the financial reserves to ensure their corporate existence and stability. The legislators of Nova Scotia never did a saner thing than when they incorporated the Dominion Coal Company, and gave that company the extended tenure of its lands and areas which made it possible to issue stocks and bonds secured on those areas. Ninety-nine years may seem a long time, and judged by the life of man, it is so long as to be tantamount to a freehold tenure, but it must be remembered that a corporation is an entity, created by the law with the right of continuous succession, an entity that may, and probably will, outlast all those who created it. It is now 25 years since the Dominion Coal Company was formed. That is to say, one-quarter of its lease period has expired, and to those who know the vast extent of the areas which this company, and this company alone, can operate, the criticism of the lease period which would naturally arise is that it is too short, too contracted to allow of the full development of the potentialities of the coal areas which it controls.

In a work descriptive of the Dominion Coal Company's operations, published in 1908, the writer stated with reference particularly to the Glace Bay Basin, that had this been worked as a virgin field by the Dominion Coal Company, or a similar consolidation of interests, the result would have been a marked conservation of our national coal resources, and incidentally, cheaper coal.* This statement cannot be controverted. It is so obviously correct; for, as the writer further stated at that time, "One could hardly

conceive from an engineering or economic standpoint a group of mines where an amalgamation of interests was more desirable, or where independent operation was more likely to have disastrous future consequences, alike as regards the profits of the operators, the revenue of the Provincial Government, or the price of coal to the consumer."

The foregoing remarks are not intended to have any bearing upon the rumored merger of the large Sydney interests; but as a reply to the "Herald's" accusation that the legislation which formed the Dominion Coal Company was ill-advised. So far as the effect of the Dominion Coal Company upon the other operators of the province is concerned, it cannot be accused of monopoly, of price-cutting, or of squeezing out the little fellow. Actually the Dominion Coal Company has been the "big brother" of the smaller coal companies. It has borne the brunt of evil times, has stabilized the industry, and in many cases has, more than any other factor in the province, made it possible for the little operators to exist at all. The Dominion Coal Company did not at any time unfairly compete with other mines in the province. Instead, it went altogether outside of the province, and developed new avenues of trade. If the Dominion Coal Company has been a monopoly, it has been a very benevolent one; but it never was a monopoly. It has, it is true, exerted a preponderating influence in the provincial coal trade, but its influence has been a stimulating one, nor can its effect on the ethics of the trade and the technical excellence of mining practice be characterized as otherwise than beneficial.

THEO. G. DENIS

The Asbestos Industry

By Jacob A. Jacobs.

The value of asbestos as a material for making incombustible thread, rope and cloth has long been known, but it is only in recent years that extensive use has been made of it. Now the architect, builder, steam-fitter and electrician recognize asbestos as a splendid material for resisting weather, fire, acids and other agencies of destruction, and they use it for very many purposes. The variety of uses is fast increasing and scarcely a month passes without some new application being found. Not many years ago asbestos was a mineralogical curiosity. Now it is a necessary article of commerce.

When asbestos was first discovered in the Eastern Townships of Quebec, over thirty years ago, its uses were so little known that the output of one quarry at Thetford could hardly be marketed to advantage, and the world knew but little of its commercial value. Gradually, however, manufacturers and others have come to realize its importance until now the demand is in excess of the supply.

In the production of asbestos, Canada occupies a leading position, as at least ninety per cent. of the world's supply of that commodity comes from the Serpentine Belt that crosses the Eastern Townships of Quebec, through the counties of Richmond, Wolfe, Megantic and Beauce, and on which are located the asbestos mines of the Danville, Black Lake, Thetford and East Broughton districts.

The mines are worked as open pits, or quarries, the rock being hoisted by means of derricks. Some mines near Thetford have already reached a depth of over 250 feet, with no indication of the pay rock running out.

The separation of asbestos from the hard serpentine in which it occurs is simple and inexpensive in comparison with the extraction of metallic ores.

After the rock is blasted the best of the vein material is extracted by means of hand hammers, and sent to the cobbing sheds to be sorted and cleaned. This is known as Crude, and brings the highest price.

The balance of the rock, classified as Fibre or Mill rock, passes to the crushers, thence to the driers and again through secondary crushers, screens, and pulverizers. From the pulverizers it passes over shaking screens from which the asbestos, now well opened out, is drawn up by vacuum fans and discharged into dusting machines. From there it passes over grading screens into bags and is then ready for market.

The percentage of marketable asbestos from the mill rock will average from 7 to 10 per cent. Of the total tonnage produced, the proportion of Crude asbestos to the whole is from 2 to 4 per cent.

Grades of Asbestos.

Asbestos is considered in two classes: Crude and Fibre.

Crude—Of the Crude Asbestos, the first handpicking is composed of fibres $\frac{3}{4}$ of an inch and over. The second picking, under $\frac{3}{4}$ inch, includes all that can be separated by hand.

Then comes the defiberized, or machine separated asbestos, generally classified as follows:

Fibre and Shingle Stock—Holding the longest fibres, fit for lining but rarely used for weaving except in case of extra quality.

Paper Stock—Containing the short fibres, and used in the manufacture of paper, felts, lumber and many other articles.

Asbestic—Or crushed serpentine rock, which is used in the manufacture of plaster, cement, fire-proof brick, etc.

Canadian asbestos has a density of 2.5; it is white or greenish in color, but the separate fibres are white, lustrous and silky, anywhere from $\frac{1}{4}$ to 3 inches in length. Single threads, or fibres, sometimes attain 5 or 6 inches in length. The veins run irregularly in every direction in the serpentine and extend sometimes a hundred feet or more.

While the Crude, or vein asbestos, is the most valuable by weight, the flaky fibrous substance that impregnates the rock in asbestos deposits is found in much larger quantities than the Crude and makes up the greater part of the production. This is generally known as Fibre, or Mill asbestos.

When asbestos was first mined, only fibres of $\frac{1}{4}$ or $\frac{1}{2}$ inch were utilized; a proportion of 1 to 3 per cent. of useful matter was considered of value, and 3 per cent. was considered a high average. Now that the whole of the fibrous matter is obtained by means of improved machinery, this proportion runs from 6 to 15 per cent. and even more than this is utilized for the manufacturing of asbestos used in building operations.

Production of Asbestos in Quebec.

The production of asbestos in Canada during recent years is shown in the following table. There will probably be an increase in value of 25 per cent. in 1918:

Year	Tons.	Value.
1903	29.261	\$ 916.970
1904	35.479	1,186.970
1905	48.960	1,476.450
1906	61.675	2,143.653
1907	61.985	2,455.919
1908	65.157	2,551.596
1909	63.965	2,296.584
1910	80.605	2,667.829
1911	102.224	3,026.306
1912	111.175	3,059.084
1913	136.609	3,830.504
1914	107.701	2,895.935
1915	113.115	3,544.362
1916	133.339	5,182.905

1917. Considerable increase in value. Figures not completed yet. Estimated\$7,200,000

Uses of Asbestos.

The enumeration of the many uses to which asbestos is now put would make a book. For hundreds of articles for household use, and for the house itself, covered with asbestos slates or shingles, and sheathed and lined with the fire-proof plaster or board, this wonderful material has become indispensable. Some of the uses may be mentioned as follows:

Cloth—Asbestos thread, made from the highest quality of crude, is woven into many kinds of cloth and fabric, from the lighter curtains of filmy lace to the heavy drop curtains for theatres, amusement halls and the like, and for the fire-proofing of the thousands of moving picture shows now being introduced

throughout all civilized countries. Asbestos cloth is also used for clothing for firemen and employees of smelting works, blast and iron works and acid works. There is no material so useful for the safety of life and property as asbestos.

Insulation—Where perfect insulation is required, as in the case of covering for electric wires, no better non-conductor can be found. It is not affected by many of the chemical agents likely to attack most insulations. It also makes the best covering for piping in connection with refrigerating plants, or for steam pipes, boilers and other places where a prevention of radiation or cooling is required, being used in this case as a binder for magnesia coverings.

Paints—Under the name of "Plastic," etc., asbestos is now used in the manufacture of certain paints, the fibrous structure having the property of holding up the heavier pigments in the paint. When used with paint containing lead and zinc it adds certain properties which no other pigments can give.

Paper—Over 90,000 tons of asbestos paper was used last year in building construction. This paper is damp-proof as well as fire-proof and its use is highly recommended by insurance companies.

Plaster—Asbestos, or refuse, when mixed with caustic lime, produces a perfect fire-proof wall plaster for either inside or outside work, and its cheapness will make its use more general as the economical qualities become more known.

Fire-Proof Brick—Composed of hydraulic lime, sand and asbestos. These bricks are now used where high temperatures are required, as in lining for furnaces, fire-boxes, etc. No other material will resist extreme heat so well.

Conveyor Belts—Owing to their fire-proof and wearing qualities, and their recognized superiority to rubber, leather, or canvas. Asbestos conveyor belts are used where hot clinkers and other substances have to be mechanically disposed of. The durability of these belts also commends them in all cases where crushed rock, copper or other ores have to be handled in bulk.

Floorings—Asbestile tiles and boards are used for floorings. They are impervious to heat or water and their elasticity is as high as wood. They have the hardness of cement, greater durability than asphalt, are light in weight, will not crack and are non-conductors of sound.

Household Goods—Asbestos felting is made into many articles for the house, such as: Table covers, stove mats, rugs, gas logs, fibre for grates, etc.

Asbestos Lumber—In modern building constructions, Asbestos wood is now largely used because of its fire-proof and water-proof qualities. It also enters into the making of electrical switch-boards, cut-offs, etc., and in the protection of trolley and electric cars against short circuiting.

Rope—Used in the manufacture of twine, cord and wirecorded rope required by fire departments.

Asbestos fabric has a greater tensile strength than cotton fabric, a statement which is evident when you consider that an asbestos fireproof rope of $\frac{3}{8}$ inch diameter has a tensile strength of 1650 pounds.

The additional mention of automobile brake linings, filters, imitation leather, mattresses for engine lagging, cigar lighters, protected metal, cement, fire-proof linings for stoves and automobile tires, does not nearly complete the list of uses in which asbestos has a part. In fact, it would be difficult to name them all.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.

Trethewey Co. Will Develop Gowganda Property.

Camps are being erected on the Castle property at Gowganda, and arrangements are being made for an extensive campaign of exploration and development. This property recently passed under control of the Trethewey Mining company, of Cobalt. The mining plant which is to be installed on the property has arrived at Elk Lake and is being transported over the winter roads to the property, a distance of about twenty-five miles. The Castle adjoins the Miller Lake-O'Brien.

Developing Hill Gold Mines Property in Munro.

About thirty men are employed at the property of the Hill Gold Mines, near Painkiller Lake, in Munro Township. The shaft has reached a depth of about 75 ft., and the mineralization of the vein is satisfactory. Camp buildings for the accommodation of about fifty men have been erected, and the work of transporting supplies to the property over the winter road from Matheson is in full swing. Operations will be pushed vigorously at this property from this time forward.

Better Road to Gowganda is Needed.

The rate for the handling of freight from the end of the steel at Elk Lake to Gowganda has recently been increased from 75 cents per cwt. to \$1 per cwt. An urgent plea is being made for a macadamized road to this camp, to be built during the coming summer. The inadequacy of the transportation facilities to this district has always been a retarding factor in the promising district, and anything that is done in the way of relieving this condition is hailed with pleasure by the large number of property owners in the camp. A large number of promising prospects are undergoing more or less development at the present time, and with the added burden of one cent per pound for freight, the results have to be exceptionally promising to induce extensive development.

More Satisfactory Results at Dome Lake Mine.

Developments at the Dome Lake Mine, in Porcupine, are more satisfactory at the present time than for some time past. At the 500-ft. level, in a crosscut, ore of a considerably higher grade than that obtaining in other portions of the mine has been encountered. The development is important, in view of the fact that it has been contended by the management that the geological conditions strongly indicated greater possibilities at depth.

Kirkland Lake Gold Mines, Ltd.

It is rumored that the Mining Corporation of Canada will unite with the Beaver Consolidated Mining company in the development of the Kirkland Lake Gold Mines, Limited. It is stated that preliminary negotiations have already been begun and that the chances of them being successfully consummated are exceedingly bright.

Development of Burnside Property Begun.

Work has commenced on the Burnside property, at Kirkland Lake, which is under option to the Cobalt-Aladdin Mining company. The connections with the Sylvanite plant, which is to be used in the development of the Burnside, were completed about two weeks ago. A new shaft is to be sunk on a vein a short distance west of the old number one shaft. This working will be driven to a depth of 155 ft. at which point a cross

cut will be run north to the boundary of the Tough-Oakes, where the No. 1 vein of the latter property is expected to be picked up. The old No. 1 shaft will also be driven to deeper levels, and the ultimate plan of the management is to connect these two shafts at the depth of 155 ft. There are fourteen known veins outcropping on the surface of the Burnside in a number of which high gold values occur. Geological conditions on the Burnside are identical with those prevailing on the Tough-Oakes, and the opening up of the neighbor of the pioneer mine of the district will prove an interesting step in the development of the Kirkland Lake camp.

Elliot-Kirkland Vein Cut at 425 Ft.

The crosscut at the 425-foot level of the Elliot-Kirkland mine has cut the downward continuation of the vein. At the point where encountered, the vein was found to be about twenty-eight feet in width. While results of the values encountered have not been given out as yet, the vein is well mineralized, the composition being similar to that encountered in the crosscut at the 300-ft. level.

Planning Railroad for Kirkland Lake.

A conference of the mine managers of the Kirkland Lake camp and officials of the T. & N. O. Railway was recently held with a view to determining the ultimate location of the branch of the railway which it is anticipated will be constructed when conditions become more favorable. The idea in view by the mine managers was to enable them to construct their plants in such a manner as to make as few changes as possible necessary when the spur line is completed.

Cobalt Silver Output Continues Large.

The daily production of silver in the Cobalt camp is being maintained at a rate of approximately 53,350 ounces per day, or 1,500,000 ounces per month. At this rate, with the prevailing price for the white metal, the value of the product bids fair to exceed in value the output of any previous year in the history of the camp.

Nipissing.

During the month of January, the Nipissing mining company, Cobalt, produced ore of an estimated net value of \$307,019, and made shipments from Nipissing and customs ore of net value of \$310,881. Operations underground were of a similar nature to the previous month. No new veins were found, but most of the month's development work continued to be satisfactory. Part of the month's production came from shaft No. 63, on the property which has recently been placed in working order. Exploration in new areas will be carried on from this shaft. A diamond drill was in operation during most of the month on claim R.L. 407, the work being done mainly to determine formations. Further work has been planned in other sections of the property which will keep this drill busy most of the winter. Both high and low grade mills occupied part of the month in making their annual clean-ups, but are now treating 1918 production. During the month of January, the high-grade mill treated 53 tons and shipped 348,954 fine ounces of silver. The low-grade mill treated 6,396 tons. The value of the production for the month was as follows: Washing plant, \$178,404; low-grade mill, \$128,615.

Dome Mines.

Operations at the Dome Mines have been resumed on a small scale. The work being done at the present time is the driving of the main shaft from the 800-ft. level to a depth of 1000 ft. It is reported this working

will ultimately be carried to the 1500-ft. level. When the desired depth is reached, an extensive exploration programme will be undertaken. Should ore be opened up as indicated by diamond drill cores, development work on a large scale can then be gone ahead with. The 35-ft. sump below the 800-ft. level has already been timbered and sinking is now under way. The work is being done by the company itself, and not by a firm of contractors, as reported.

Peterson Lake Will Instal Oil Flotation Plant.

Plans have been completed for the installation of the oil flotation plant at the Peterson Lake Mining company's property, at Cobalt. The treatment of the tailings from the operations of the Seneca Superior mine, it is estimated, will give the company a net profit of \$30,000. The cost of installation of the plant is expected to be in the neighborhood of \$15,000.

Temiskaming.

One of the first changes at the Temiskaming Mine, as a result of the switching of control, is that the resident manager, Mr. J. W. Moffet, will be replaced by Mr. McReavy, manager of the Trethewey Mine. Mr. Moffet is also manager of the Beaver.

Alexo Make Large Output of Nickel Ore.

During the month of January, the Alexo Nickel mine, at Porquis Junction, about thirty miles east from Porcupine, and within a mile or so of the T. & N. O. Railway, shipped 21 cars containing 1,625,700 pounds of ore to the Mond Nickel company, at Coniston. This is by far the heaviest month's shipments in the history of the company, being over 400,000 heavier than the previous record month, which was October, 1917. During the past nine months the company has shipped 115 cars of ore containing approximately 9,642,200 pounds.

Davidson.

The management of the Davidson mining company, at Porcupine, expect to have their sixty-ton mill in operation by the end of the present month. The financial statement covering a period of seventeen months, ending December 31st, 1917, shows that over \$83,000 was expended in development work. Plant and machinery were valued at \$39,982, and the buildings \$19,000. The company is clear of debt. Developments during the seventeen months comprised 3,096 feet, of which 1,330 ft. was cross-cutting, 1,094 ft. drifting, 395 ft. raising and 277 ft. sinking. Diamond drilling comprised 2,115 ft., and surface work 15,885 ft. It is estimated the company have about 100,000 tons of ore of a satisfactory average value.

Porcupine Crown.

There is a growing belief in the Porcupine camp that further curtailment in the operations at the Porcupine Crown will soon be deemed advisable. The high rate of wages being paid at the Hollinger and McIntyre Porcupine Mines, it is contended, is absorbing the larger portion of the available supply of workmen. The two latter mines, owing to their physical condition, can afford to pay a higher rate of wages than many others in a less fortunate position, and in some instances wages amount to as much as eight dollars per day. This forms an economic barrier to a like policy at mines like Porcupine Crown.

Schumacher.

Mr. A. S. Wookey, manager of the Schumacher mine, Porcupine, having enlisted, the management of this property is now in the hands of Mr. T. J. Harwood, who for ten years was manager of the LaRose Mine, at Cobalt, and is well known throughout the North

Country through his connection with this mine. For about three years, Mr. Wookey has managed the Schumacher, and under his supervision the mine has developed from a prospect to a thorough-going mine with large ore reserves, a large, up-to-date mill, and with a future only second to the Hollinger, Dome and McIntyre. The milling record of the mine is second to none in the country and has resulted in a substantial margin of profit being realized in spite of the burdens of war. During the past few months the mill has been treating around 180 tons of ore per day, the profits of which have been sufficient to carry on extensive underground operations. The management decided, several months ago, to continue the main workings of the mine to the 1000-ft. level, but the mill construction during the past summer, together with the shortage of labor, have deferred this plan. Whether or not the new management will follow out this plan of operations has not yet been announced. In Mr. Wookey, the Porcupine camp is losing, temporarily, one of its most efficient mine managers.

Kirkland Lake.

A small part of the machinery for the new mill to be installed at the Kirkland Lake Gold has arrived, but at the present time operations at the property are at a standstill, and up until the present time nothing definite has been given out as to when a resumption of operations can be expected. This property belongs to the Beaver mining company, of Cobalt, and is considered to have exceptional merit. The main shaft has reached a depth of 700 ft., and where the ore body was cut at this point, the values were found to compare favorably with those of other levels of the mine. Considerable lateral work has been done on a number of levels above the 700 ft., with highly satisfactory results.

Wright-Hargraves Cuts Orebody at 200 Ft.

According to latest advice received from the Wright-Hargraves mine, at Kirkland Lake, the main orebody had been encountered at a depth of two hundred feet in the number three shaft. The orebody was found to be sixteen feet in width, the mineralization of the vein being very similar to that found at other points on the property. The number three shaft will be continued to a depth of 300 ft., after which it is planned to drift east to connect up with the number two or main working at that level, a distance of nine hundred feet. Until such time as this is accomplished it will be difficult to estimate the ore reserves of the mine. However, a large portion of the ore already encountered runs over \$20 to the ton, and a considerable quantity is said to carry values of over \$50 to the ton, which makes the outlook exceedingly good. Within the next few months the management should be able to intelligently estimate the ore blocked out and there would appear to be every reason to believe that the total will be well up in seven figures. This property is rapidly developing into one of the leading mines of the Kirkland Lake district.

McIntyre.

One of the outstanding features of the report of the McIntyre-Porcupine Mines for the period covering the last half of the year 1917, is the large amount of development work done. During this six-months' period nearly three-quarters of a mile of underground work was done. Increased production was also shown in the report, but at the same time increased costs held

the profits below the previous six-months by some \$7,000. The development work was stated to be satisfactory. In connection with the Plenaurum property, it is announced that the option has been extended to Dec. 31st, 1918. The Jupiter shaft has been completed to the 1000-ft. level, and a station is now being cut at this point. When this work is completed, a drift will be started east to explore the plenaurum and the eastern portion of the Jupiter. The total footage of underground work accomplished during the last half of the year was 3,796. In addition to this, 2,739 ft. of diamond drilling was done. Development work throughout the property continued highly satisfactory. Drift No. 1026, on the 1000-ft. level of the main shaft, has penetrated the Jupiter claim for a distance of 600 ft. Owing to this drift being the main haulage way for ore coming from the Jupiter claims, it has been taken off the vein and is being driven through the quartz-porphyry to make a direct connection with the Jupiter shaft. The territory lying to the north is being explored by diamond drill from this drift. Preparations are under way to sink the main shaft to a depth of 1,300 ft.

Hollinger.

The annual report of the Hollinger Consolidated Mines, of Porcupine, issued early this month, should prove pleasing to the shareholders of the company, particularly the statement made by the President, Mr. N. A. Timmins, that: "If labor conditions become no worse, an early resumption of dividends may be expected." Although holders of the stock did not receive much in dividends during the year just passed, it is gratifying to note that the ore reserves of the mine have increased from \$34,185,000 to \$40,231,000, or an increase of forty per cent. on the authorized capital of the company. Besides this, since the time of discontinuing the dividends a deficit of \$269,590, which stood on the books at the beginning of 1917, has been wiped out and a surplus of \$713,734 has been added. The expenditures for plant amounted to \$673,000, and \$131,224 was charged to capital development, with \$100,000 written off for plant depreciation. During the year just closed the company exposed \$10,300,000 in new ore. The estimate of the ore reserves was based on the territory above the 800-ft. level, while the president intimates that the ground below that level, being unexplored virgin territory, has enormous speculative value.

A portion of the new milling equipment is being tried out at the mine, and one unit of twenty stamps has already been tested and found to be operating satisfactorily. The plan adopted is to try one section at a time, and as one section of the new mill is found satisfactory, another is brought into play, and this will be continued until such time as new installation, with a capacity of one thousand tons per day, is brought into play. However, owing to the scarcity of labor as each section of the new mill is brought into use, a similar portion of the old mill is closed down, thus it will be seen that it is not certain that production will be greatly increased until such time as efficient labor becomes more plentiful. Wherever practicable, either on surface or underground, most modern equipment is being installed tending toward greater speed with smaller working forces. Thus, the Hollinger should be able to continue a very large output, despite the hardships of a prolonged war.

BRITISH COLUMBIA.

In the course of his address to the Legislative Assembly of British Columbia, when opening the Provincial Parliament, last month, His Honor the Lieutenant-Governor made the following references to matters relating to the mining industry:

"Owing to the existing conditions under which the precious and base metals in the Esquimalt and Nanaimo Railway belt, Vancouver Island, are held jointly by the railway company and the Province, you will be asked to consider the situation, to the end that the area involved may be given more attention by prospectors and investors.

"The disabilities against the acquisition of mineral claims under the mining laws of the Province now existing in Strathcona Park, Vancouver Island, will be removed, subject to restrictions as to the acquisition of surface and timber rights.

"My Government is securing the services of an expert to advise on the electro-thermic treatment of iron ores, and measures for the encouragement of iron and steel industries will be presented for your consideration."

Plans for Steel Works.—A press despatch from Vancouver, published in Victoria, reads as follows: "Mr. H. R. Tudhope, a member of the Orillia manufacturing firm which is behind the proposal to establish an electric smelting and steel-plate mill in Vancouver, accompanied by Mr. W. L. Renton, general manager of the Pacific Steel Co., and former vice-president and manager of the Electric Steel and Metals Co., of Welland, have returned to Vancouver from Victoria, where they had a lengthy session with Premier Brewster, Hon. J. W. de B. Farris, K.C., and Hon. William Sloan, Minister of Mines.

"Hon. Mr. Sloan expects to name within the next day or two the metallurgical expert who is to give an independent opinion upon the various questions involved in the proposals for establishing an electrical smelter and steel-plate mill. In the meantime, it is said, the representatives of the steel interests discussed with the members of the Cabinet most interested in the proposal many of the features and problems in connection with the proposal, and were accorded a friendly and sympathetic hearing.

"The Tudhope interests are behind both the Pacific Steel Company at Eburne and the Aetna Steel Works at Port Moody, both of which plants are now undergoing change from oil-burning furnaces to electrical furnaces and other improvements to increase their production of steel fivefold. Pending the opening of iron ore deposits which the new furnaces being installed are said to be capable of handling, the two plants are working on scrap material, which is melted and rolled into rods, angle irons and other forms of iron and steel needed in ship work."

Vancouver Island Moves, Too.—Public bodies on Vancouver Island are also active, in efforts to secure the establishment of an iron and steel industry on the Island. A representative Central Iron Committee has been formed and a numerous delegation from it has waited on the Provincial Minister of Mines with the object of ascertaining what action the Provincial Government proposes to take with respect to utilizing the iron ore deposits of the Province. This committee has formulated proposals which are, briefly, to ask the Provincial Government to immediately proceed with the selection of a fully qualified iron expert and metallurgist to examine and report on the iron ore de-

posits of Vancouver Island and the adjacent islands as well as the necessary elements required for the production from those deposits of pig iron, and to appropriate the necessary money for the carrying on of these experiments, such experts to be independent and not associated directly or indirectly with any corporation or person connected with the iron and steel industry; that the Government immediately place a reserve on all unstaked iron lands on Vancouver Island or adjacent islands; that power be given the Minister of Mines to take steps to operate these iron mine claims and that the Government restrict the exportation of raw iron ores similar to the way the exportation of timber from the Province is now being restrained.

It is considered by the committee that the first logical step in their undertaking is to secure to the Province its resources by means of amending legislation which the local Government will be urged to bring down in course of the present session of the Legislature. The object of this is to forestall the stealing away of the iron resources through purchase by agents of existing corporations, to whom an industry of the proportions desired here would eventually become a competing factor. Being able thus to guarantee an unrestricted supply of raw material, the committee proposes to approach the Dominion Government for aid to development by way of a bonus, or such assistance as may seem advisable, as a war measure.

PRINTING AND PUBLISHING

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

Oxy-Acetylene Welding and Cutting

Welding all seams, flanges and nipples by Prest-o-Lite Process at a great saving in cost.

Leak-Proof Tanks
Cost Less to Make

This illustration shows one of a series of welded tanks, used by a large manufacturing company to contain a searching chemical liquid. Conclusive tests proved the tanks positively leak-proof. They cost much less to make by welding than by any other method.

In thousands of shops and factories, the Prest-O-Lite Process of oxy-acetylene welding is displacing the rivet, bolt and threaded joint. The result is neater, stronger work and reduced cost.

For routine construction work, or "on-the-spot" repairing, the Prest-O-Lite Process is unequalled.

Prest-O-Lite
PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

MODERN METHODS IN STEEL AND IRON

Electric Furnaces, Arc Welders, Motors, Generators, Transformers, Switchboards and General Supplies

Among the advantages of electric heat are greater thermal efficiency, since electric energy is changed into heat without loss and utilized at many times the efficiency of combustion devices; more positive and accurate control; concentration at desired point; greater product and better quality for a given time.

Any problem involving the use of power can be simplified by the application of electricity. The Canadian General Electric Company is well equipped to lend valuable assistance in working out such problems and is glad to co-operate with manufacturers, engineers and contractors in every possible way.

“LITTLE GIANT”**

Spiral
Feed
Burns
6 Hours

No. 110

Here is the story of carbide lamp satisfaction all wrapped up in the word “Justrite.” The reason is fundamental—the same as for other products of merit. It took the best material, splendid workmanship and practical workaday knowledge of ore mine conditions to produce it. There was a need for a lamp producing a steady, penetrating flame. The Justrite is just such a light. Each lamp is strongly made of brass or aluminum; equipped with self-lighter, and special water feed which eliminates clogging and produces a steady flow of gas.

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured within the Province.

Ontario in 1916 produced 45 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1916 to be worth \$65,303,822, of which the metallic production was \$55,002,918.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

Minister of Lands, Forests and Mines,

Toronto, Canada

Latest Model
No. 6 Wilfley Table

68 No. 6 Wilfley Concentrating Tables at the New Jersey Zinc Co. Plant

Wilfley Tables were used at this plant for many years. And when new equipment was required for increasing capacity, there was but one choice—Wilfley Tables.

This notable installation is within two hours ride of New York City. All over the world Wilfley Tables may be found, giving uniformly satisfactory service.

During the past 20 years over 20,000 Wilfleys have been built. Today more of them are being sold than ever before.

There are concrete reasons for the world-wide use of Wilfley Tables. Their durability and efficiency, developed by many years' experience in manufacturing concentrating tables—their simplicity in design, permitting moderate price—their simplicity in operation, securing low labor and operating costs—these are some of the features that distinguish the Wilfley.

It is backed, moreover, by the Massco Organization—a world-wide service supplying practically every need of mine, mill or smelter with equipment which is guaranteed as to quality.

The Wilfley Table merits your closest investigation. Its record speaks for itself. May we send you literature giving the details of design and construction?

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

- Applicants for publications not listed above should mention the precise area concerning which information is desired.
- Maps published within recent years may be had, printed on linen, at the nominal cost of ten cents each.
- The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.
- Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

USERS of the Callow Cell are naturally interested in knowing how the decision of the United States Circuit Court of Appeals for the Third District, in the Miami case, will affect their interests.

As we understand the prevailing opinion of Judge Woolley in the Miami case he has interpreted the Supreme Court decision in the Hyde case as meaning that "*invention resides not alone in the critical proportion of oil, but also in air and agitation,*" and again, "*in the co-action of the critical proportion of oil and air effected by 'an agitation greater than, and different from that which had been resorted to before,' resulting in a froth concentrate of economical value,*" and further, that the Supreme Court did not limit the patent to "*agitation by mechanical means,*" but to agitation of a violent and persistent kind; "*it mixes the oil with the metal of the ore. This is old. Then, by its greater intensity and longer duration, it stirs the pulp into a froth.*"

Thus, this decision of the Third Circuit Court of Appeals has a most important bearing upon the art, because it holds that the mixing of the oil with the mineral is old, but it **leaves open the use of oil in connection with aeration-cells.** Meanwhile the idea of a "*critical*" proportion of oil has been dis-

proved by practice in several mills within a short time after it was promulgated.

Judge Woolley says further, concerning the Callow Cell: "*Aeration is direct, and is not the result of or caused by agitation. On the contrary, agitation results from aeration and such agitation, though present in some measure, is not even approximately of the violence and duration of the agitation of the patent. The operation in the Callow Cell certainly possesses these distinguishing features from operation of the process where aeration is caused by agitation.*"

The Court further confirms this important dictum by saying: "*If the only agitation to which the pulp was subjected (after such agitation as in the prior art was necessary to mix the oil and ore) was the agitation of the Callow Cells, we would not say that that agitation amounted to or was the equivalent of the violent agitation of the patent disclosure and constituted infringement.*"

Apparently users of the Callow Cell may feel assured they do not infringe the method of agitation described in U.S. Patent No. 835,120 (less than 1% oil), No. 962,678 (soluble frothing agents), No. 1,099,699 (phenol or cresol in the cold without acid) since all three of the patents are of the same process, dependent upon a certain degree of violence and length of agitation and the production of the same characteristic froth, as set forth in their claims.

(Signed) J. M. Callow.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

HOMESTEADS

IN THE BANNER HOME PROVINCE OF ONTARIO

20,000,000 Acres of the Finest Agricultural Land in Canada, Waiting for You in
the Northern Part of Ontario.

Think of it! Homesteads available at 50 cents per acre—close to railroads—close to markets—close
to civilization and attending advantages.

Land of opportunity—you can make yourself a home within a short day's journey of Toronto.

Land lies in one of the best belts of Canada, along the TEMISKAMING AND NORTHERN ON-
TARIO RAILWAY, which has connections with the G. T. R., C. P. R., C. N. R., and C. G. Railways,
thus bringing the settlers within easy reach of the profitable markets of the continent and Europe.

Prosperous towns growing into cities; in this way local markets available to the settler for buying
and selling.

You may have a happy home and a fertile farm at 50 cents per acre in your own home Province of
Ontario—why, then, go far afield for these ideal conditions?

Exhibits of the products and of the possibilities of production of New Ontario's land have been
shown at Canada's National and other Expositions, so that it is now known as Canada's land of pro-
duction.

Not only land of agriculture, but embraces large and rich mineral belts from which annually mil-
lions of dollars of gold and silver are mined.

"Little David" Hoist in Mine Winze.

Send for Bulletin 4133. It tells much that will interest you.

Booklet "Billy-isms" for the asking also. What Billy did may surprise you

Any Way
That is Handy
Is the

"LITTLE TUGGER"

Way of
Hoisting

Bolt it to a timber—clamp it to a column, an arm or a pipe—under or over—at the side—'most anywhere.

You can use wire rope or manilla rope, and run by either steam or air.

The "Little Tugger" hauls as well as hoists. The drum holds so much rope, and the hoist is built in such a way that it will stand up to both jobs. Not every portable hoist can do this, you know.

Conserve Your Man Power and Reduce Operating Expenses

The first is absolutely necessary from a patriotic standpoint—the second is the first thought of every successful business man. Both can be accomplished when you install the "New Cleveland" Stoper in your mine. It has speed, with staying power and efficiency, double that of any other drill on the market. It has lower operating expenses, because of its low air consumption, and its economy in repairs, through its drop forged parts of simple design which are practically unbreakable.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,510; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Reduce Your Haulage Costs With A PORTER

The safety and efficiency of compressed air haulage have been brought to the highest standard in Porter Locomotives. To these we have added an economy in cost and upkeep that no man interested in mine haulage can afford to disregard.

Write for full details to-day.

CANADIAN H. K. PORTER CO., 1218 UNION BLDG., PITTSBURG, PA.

is the trade-marked name for pasteurized separated

ONTARIO MILK

in dry form. Government Inland Revenue Bulletin No. 257 states that separated milk powder "contains no adulterants," "is true to the claims made for it" and is genuine."

Klim is the most economical form of milk. It bulks smallest and weighs less than any other form of milk, thus effecting over 50% saving in freight charges. It remains sweet and fresh indefinitely. Can be used from the tin as needed. No waste from spoiling. Mix dry with flour, sugar, etc., in cooking or dissolve in water for use as liquid.

A miner's wife writes: "I have used Klim for everything, with most satisfactory results."

Klim is sold in 1-lb. tins and 10-lb. tins. The larger size is more economical. Ten lbs. makes forty quarts of liquid with the natural milk taste.

Bore Hole Exploration	96
Composition of Natural Gas	96
Annual Meeting of the Canadian Mining Institute	97
Preliminary Report on Production in 1917	102
A Barytes Mine in Northern Ontario	105
An Iron Industry for British Columbia	106
Special Correspondence	107
Markets	109

In our March 1st issue we published three articles by officers of the Department of Mines, which help to show some of the lines along which much progress has been made recently. The summary of the preliminary report on production, prepared by the Division of Mineral Resources and Statistics, of which Mr. John McLeish is chief, is continued in this issue. The article by Mr. M. E. Wilson, of the Geological Survey, gives some idea of the character of the great molybdenite deposit developed at Quyon, Quebec. The article by Mr. Howells Frechett of the Mines Branch contains much useful information on the development of the magnesite industry in Canada. The credit for the preparation of these articles belongs to the Mines Department.

ONTARIO'S PLATINUM AND PALLADIUM.

The scarcity of palladium and platinum and the high price that can be obtained for these metals should draw more attention to the fact that we are not making proper use of the considerable quantities of these metals contained in the ores mined and smelted in the Sudbury district.

It is well known that the Sudbury nickel-copper mattes contain important quantities of the precious metals: gold, silver, platinum and palladium. The report of the Ontario Nickel Commission shows clearly that a large percentage of these metals is being wasted. The magnitude of the waste is, however, not commonly appreciated.

From the publications of the Ontario Bureau of Mines we know that there was produced in Ontario in 1916 80,010 tons nickel-copper matte. This matte contained at least 20,000 and possibly 30,000 oz. of platinum and palladium. In 1917 the production was 78,897 tons of matte. During the past two years, therefore, there has been produced in Ontario matte containing a very large amount of these precious metals. The exact amount is unknown to us; but 50,000 oz. for the two years is, perhaps a conservative estimate. Assuming \$100 per ounce as the value of these precious metals, we have the handsome amount of \$5,000,000 as the value of the platinum and palladium contained in ore mined in Ontario in the past two years.

Why does Canada get no credit as producer of the precious metals recovered from the mattes? How much is being recovered from the mattes in other countries and how much is being wasted? We have not the data necessary for the preparation of a reliable estimate; but we would not be surprised to learn that Ontario platinum and palladium wasted in the past two years amounted to over \$3,000,000.

In this connection the following paragraph from the report of the Ontario Nickel Commission is interesting: "The nickel-copper ores of Sudbury are capable of producing much more palladium than the whole of the present world's supply, together with a very large proportion of platinum, iridium and other metals of the platinum group." How much is being produced from Sudbury ores?

"Iron and Steel," a new journal, devoted to the steel and iron industry of Canada, is now being published by the Industrial and Educational Press, Montreal. The first two numbers contain much useful information and the journal merits a wide circulation among those interested in iron and steel production and manufacture. Mr. Alfred Stansfield is editor-in-chief and Mr. W. G. Dauncey is associate editor. Mr. Stansfield is secretary of the newly formed Iron and Steel Section of the Canadian Mining Institute.

The election of Mr. D. B. Dowling as president of the Canadian Mining Institute should result in increased activity in Institute affairs in the branches in coal mining districts. Mr. Dowling was nominated by members of the Rocky Mountain branch, and, as his headquarters are at Ottawa, the West will have the advantage of a representative in the East at all important Council meetings. Mr. Dowling is one of the senior officers of the Geological Survey and is, of course, familiar with the varied problems that the Institute has to deal with. His peculiar position as a link between East and West is one which suggests a special field of usefulness, and one which he can be counted upon to develop in the best interests of the Institute.

CORRESPONDENCE.

Bore-Hole Exploration.

Editor, Canadian Mining Journal:

Sir,—In your issue of January 15th, under the heading, "Bore-Hole Exploration," I note the statement that "the Knight and Stone double tube core barrel is considered the best double tube core barrel on the market." To experienced drill operators and those familiar with the various types of core barrels, it is unnecessary to comment on this statement, but as the article apparently was intended for general information on an interesting subject, a brief description of the types of double tube core barrels and their advantages may be of interest.

The so-called "Knight and Stone Core Barrel" is a modification of the old rigid type core barrel, which barrel consists of an outer and inner tube, rigidly connected, so that both turn together. The advantage of this type over the single tube is that the water passes between the two barrels and reduces washing of soft core to a minimum. The modification to this barrel mentioned is in a provision for returning part of the water through the inner tube and out into the hole at the top of the core barrel. The advantage claimed for this barrel is that the upward motion of water in the inner tube tends to lift the core. The theory is that if water passing down through a single tube barrel washes core out, then an upward stream should wash it in. In practice, the important thing is to reduce the washing to a minimum, so that when soft, decomposed or friable material is encountered, the flowing water in the inner tube defeats the very purpose of the double tube barrel, namely, to prevent washing. In gravel or material of similar nature, there is some advantage in this type of barrel, but for the ordinary soft ore, for which a double tube barrel is generally used, the old rigid type is preferable.

When it is desired to get accurate records in soft or friable material, such as clay, salt, soft ores, decomposed material or coal, or where it is important even in hard, solid formation, to get the maximum amount of ore, the standard Sullivan double tube core barrel, ball-bearing type, is by far the most reliable barrel. This barrel is more elaborate and expensive than either of the barrels referred to. It is so designed that the inner tube is suspended from ball bearings at the top and does not rotate with the outer tube.

That is to say, the outer tube, to which is attached the bit, does the cutting, and the inner tube passes over the core without friction or vibration and protects the core entirely from the washing effect that is objectionable in the single tube or rigid tube core barrel. No more convincing proof of the superiority of the ball-bearing type can be given than the fact that in drilling coal, which is one of the most difficult materials to core, the Sullivan barrel is in universal use.

I am sending you a cut of the ball-bearing core barrel, which I happen to have, and this will show clearly its construction. I regret that I do not have a cut of the rigid type, but, as stated, it simply consists of two barrels that are rigidly connected and turned together. In appearance, as far as the cut goes, they are very similar, but it will be readily understood that there is quite a difference in the action of these two barrels.

I have been in charge of drilling operations in various parts of the world for the past twenty-five years and I do not hesitate to say that where accurate records are desired, the double tube ball-bearing type core barrel is far superior to anything I have ever seen.

Yours, etc.,

E. J. HARRINGTON.

Flower Station, Ont., Feb. 25, 1918.

Composition of Natural Gas.

Editor, Canadian Mining Journal:

Sir,—Some little time ago there was an interesting correspondence with regard to the composition of natural gas, and probably, therefore, the following particulars in reference to something quite unusual may be of interest to your readers. The full text will be found in the 1918 Year Book and Souvenir Programme of the Spokane Mining Convention, on page 87:

"Natural gas and oil fields have not been developed to any extent in the Pacific North West, but there are indications of both oil and gas. . . . In at least one district natural gas has been found in quantities that suggest important possibilities, and the probability, also, of oil deposits of value. This district is Benton County, Washington, near the centre of the State. The Spokane—Benton Natural Gas Co. are the operators, and they propose to pipe the gas to Spokane, a distance of 120 miles. One well is producing one million cubic feet of gas per diem from a depth of 706 ft. A pond of water on the anticline keeps at one level all the time and has a scum of petroleum oil always showing on the surface.

"The analysis of the gas is the remarkable point, this analysis gave: methane, 76.6 per cent.; ethane, 12 per cent.; propane, 7.20 per cent.; butane, 8.80 per cent., and 0.40 per cent. of oxygen."

It may be remembered that in the writer's previous communication on this subject he referred to the occurrence of other gases than methane, and also of hydrogen. He is satisfied that if other gas well products were examined and reported on, we might have very valuable information in regard thereto.

The writer also thinks that the gas above reported on was probably a wet gas.

Yours, etc.,

JAMES ASHWORTH.

921 Drake St., Vancouver, B.C., Feb. 22, 1918.

Annual Meeting of the Canadian Mining Institute

The meeting of the Canadian Mining Institute, held in Montreal on March 6th, 7th and 8th, was a very successful one. The program proved interesting, large questions being dealt with in an able manner by those who undertook the preparation of papers on matters of national importance. Spirited discussion was aroused by some of the papers on fuels and the Friday morning session was enlivened by a spirited defence of the Commission of Conservation.

Iron and Steel Section Formed.

An event that may prove to be of great importance to the Institute was the foundation of a Section on Iron and Steel. Numerous representatives from the iron and steel industry attended the meeting and decided in favor of the suggestion that they should organize in the interests of the industry and that the Canadian Mining Institute, of which several are already members, is the organization with which they should affiliate. As it is the purpose of the Canadian Mining Institute to further the interests of mining and metallurgy in Canada, the formation of an Iron and Steel Section is a natural development. It is understood that the Section will have a very capable executive including: Robert Hobson, Hamilton, Ont.; Col. Thos. Cantley, Mark Workman, W. C. Franz, Dr. Alfred Stansfield, W. J. Janssen, H. M. Jacquays, J. A. Irwin, C. F. Bristol, Esmond Peck, G. H. Duggan and P. L. Miller, Montreal; J. J. Hartley, Kingston; J. H. MacDougall, Sydney, N.S.; F. Crookard, New Glasgow, N.S.; Geo. W. Watts and Wm. Inglis, Toronto; J. G. Morrow, F. A. Sherman and W. M. Curry, Hamilton, Ont.; Col. David Carnegie, Ottawa; Capt. David Kyle, Sault Ste. Marie; M. Deakins, Winnipeg; Fleet Robertson, Vancouver; Geo. McKenzie. This committee will start in on the work of organization at once.

President Cole's Address.

President A. A. Cole, in his address, emphasized the fact that Canada, because of her vast resources of raw materials, would be one of nature's most favored nations, and all must prepare to take advantage of this, and do what they could to encourage greater independence and national self-reliance in its national development. Their principal work must be carried on through Governmental departments, and the Institute had urged the consolidation and strengthening of the Department of Mines, an essential part of which was improving the financial status of the technical members of the staff. The work of the department should be extended so that not only would it deal with the mining and manufacture of minerals and mineral products, but could closely study markets in close co-operation with the Department of Trade and Commerce. Closer co-operation between the Department of Mines and the provincial bureaux should be encouraged, also co-operation among producers with the sanction and support of the Government should be a watchword within the industry.

Organized action by the technical and industrial associations of the Dominion was advocated at the opening sessions. This came up in the course of a general discussion, and was approved in the following resolution, proposed by Dr. W. L. Goodwin, Kingston, seconded by Mr. R. H. Stewart and unanimously

adopted: "That, in the opinion of the Canadian Mining Institute, the time has come for the organization of the technical and industrial societies of the Dominion in such way as to enable them to take joint action in the interests of the Canadian industries, and that this subject be remitted by this meeting to the council of the institute for such consideration and action as will promote such organization."

The status of the metallurgical end of the society was also urged by Dr. Alfred Stansfield, of McGill University, with a proposal to change the name of the institute, so as to include the metallurgists, who form an important branch of the institute. In view of the amount of work that lay ahead of the meeting, Dr. Stansfield withdrew his resolution for a year, with the hope that it would not be lost sight of.

Work of J. E. Hardman and J. S. Brown Recognized.

A luncheon was held by the convention at the Windsor at one o'clock, at which the president, Mr. A. A. Cole, took the chair. He was greeted with considerable applause when he announced that a resolution had been unanimously passed by the council to commemorate the 20th annual meeting of the institute by conferring life memberships on their first member, Mr. John E. Hardman, of Montreal, and Mr. J. Stevenson Brown, of Montreal, who was for many years their treasurer.

The report of the council showed that there had been an increase in membership during the year. There were 125 members on active service, and eleven members had paid the supreme sacrifice at the Front. The total membership was 1,118, as against 1,066 in 1916. There had been 86 losses by death, resignation and removal. The treasurer's report showed a total of \$20,385, with a balance of \$1,990.

Considerable discussion took place during the afternoon session with regard to Government commissions, the general opinion being voiced by Dr. Miller, who considered that there had been too much commission business, and that work should be left more to individual enterprise.

This idea was supported by Dr. J. B. Porter, of McGill, who thought there had been too many commissions appointed. At the same time, he expressed the idea that there had been preposterous extravagance in mining and the utilization of fuel. To correct this, he thought that something might be done by appointing a central advisory body to give assistance to the legislative bodies already in existence. The need for this, he said, was shown by the wasteful methods of many small coal operators, who were simply "picking the eyes" of the mines by surface methods, and injuring their ultimate development.

Reconstruction Problems.

An interesting paper was read by Col. David Carnegie, of the Munitions Board, Ottawa, on "Some Problems in the Reconstruction of Industry."

In his address, Col. Carnegie dealt with two main problems—how to secure remunerative trade without unfair competition, and how to maintain efficient production with competitive co-operation. These two problems, he said, chiefly concerned the consumers, the sellers, the manufacturers and the workers.

With regard to the first problem, Col. Carnegie said that the great difficulty to be encountered was the indifference of people to rapid and revolutionary changes in industry, while the system of unfair competition in business really formed a public danger. This unfair competition, he said, was due to self-love and natural liberty. While not extolling German methods generally, he pointed out the excellent results that had been secured in Germany by the system of control.

For the solution of these problems, Col. Carnegie proposed a system which would utilize the best brains in each industry for controlling that industry. To this end he suggested the organization of two distinct bodies from each industry, one to secure trade and the other to encourage the production of materials. These national organizations, he suggested, should be called national and district trade boards, and district production boards, working under Government sanction.

Dr. A. W. G. Wilson read a paper on the stimulation of the mining industry after the war, pointing out that no other industry was independent of the mineral industry. Canada was economically dependent on other countries for many commodities, while many Canadian industries were wholly or in part controlled by foreign capital. Dr. Wilson said it was advisable

A motion was made by the President, seconded by Dr. Davidson, endorsing the need of educational reform as a basis for the removing of misunderstandings of the true relation of industry to the welfare of society which were the cause of the antagonistic relations between capital and labor, and the secretary was instructed to send copies of the paper to other technical and industrial societies asking them to consider the reforms advocated, so that joint action could be taken in bringing the matter to the attention of the educational authorities of the Dominion.

Many members spoke in favor of the papers, including Dr. F. H. Sexton, T. W. Gibson, deputy minister of mines for Ontario, C. J. Mackay, Toronto, Dr. Goodwin, Kingston, Prof. A. Stansfield, and others. Opposition to the scheme of Col. Carnegie was argued by G. G. S. Lindsay, of Toronto, who questioned the advisability of eliminating competition in the same manner as the Shell committee had done.

Vocational Re-education.

At the evening session Dr. F. H. Sexton gave an address on the vocational re-education of disabled soldiers from the mining industry. He pointed out that the majority of men considered unfit for further military service were not able to resume their mining

Some of the members of the Canadian Mining Institute at the Montreal Meeting, March 6th.

to consider whether some measure of the control should not be exercised by the Federal Government in connection with the establishment and location of basic industries, and whether it was not desirable to amend existing laws so that in the future the control of important mineral resources shall be vested only in the hands of residents of Canada or subjects of the British Empire. This action had been taken with respect to natural gas and petroleum resources, and it might be desirable to extend it to other similar resources that were essential for military purposes or to enable us to secure and maintain commercial independence.

The paper by C. V. Corless dealt with the Whitley scheme in force in England and pointed out that Canada would have to face the same problems as had been tackled in England, and the sooner capitalists realized this and discussed the inevitable question of the just distribution of the joint product of wealth the better. He emphasized the need of providing a sound social training in all technical institutions and of training oncoming citizens to exercise intelligently their increasing powers with their implied responsibilities, for labor had too long been left to the misguidance of half-baked Utopian social theories picked up from irresponsible but interested agitators and a cheap sensational press.

work, which required hard physical labor, but with the hearty co-operation of practically all mining companies the miners disabled by war were being trained for other occupations, and in many cases were able to earn more wages than in pre-war times.

He declared that the problem of re-establishing the returned disabled soldier was practically the first problem of reconstruction, and there was no better opportunity which had ever been offered to industry to perform a service which at once accorded in such a great degree to the best principles of national economy and the highest principles of applied Christianity.

In the discussion which followed Dr. Goodwin spoke of the classes being conducted at Kingston, and mentioned that the agricultural classes were the most popular with the soldiers.

Jas. McEvoy expressed the opinion that every returned soldier, whether disabled or not, should have an opportunity of re-education so that he could realize the higher ambitions that he had felt after taking part in the war.

A very well illustrated lecture on the Rio Tinto pyrites mines was presented by W. A. Carlyle. The enormous deposits have been worked for many centuries and the magnitude of the work was an eye opener.

Edgar Stansfield gave a brief talk on the work done at the laboratories at the capital, especially in regard to the testing of air in the mines and the carbonization of lignites. He said that the subject of the use of peat as fuel was receiving the special attention of the Department of Mines.

Fuel Problems.

Fuel economies was the subject spoken of by D. B. Dowling, who pointed out that should peace be proclaimed without the evacuation of France or Belgium, millions of tons and her iron reserves as metal by 1,025 millions of tons, and the manufactures of France would Germany would increase her coal reserves by 20,000 have to be confined to textiles and the non-metallics, and Germany would have the preponderance in coal and iron over all Western Europe, and would finally be able to lead the markets of the world. The speaker, however, pointed out there were other fuels which could be used in order to conserve the non-replaceable fuel. North America had the largest coalfields of any continent, but was also the most prodigal, and if the rate of consumption increased as in the past fifty years, the supply would be exhausted about the year 2100.

Unused Resources.

He suggested the burning of compressed straw, dead trees, and broken limbs from the forest. The water power resources of Canada totalled 18,800,000 horse power, of which at present only 1,813,200 was developed. Further research should be made to make of peat bog a solid fuel acceptable to town users.

The making of "slack coal," which was now wasted in the mines, a marketable product, was also a matter to which attention should be given. He referred to the wasteful methods in making coke, and suggested that if a large coking plant were established in Montreal, the gas produced could largely replace the use of coal and the coke could be shipped to Ontario. The recovery of the tar and other by-products would form a very important industry and supply much of the material now imported.

The Anthracite Situation.

That the coal shortage of the past winter was not the fault of the engineers and operators, or their employes, was asserted by Eli T. Conner, who spoke on the anthracite situation in the United States. The output from the anthracite region of Pennsylvania during 1917 was ten million tons more than in the preceding year, notwithstanding the shortage of sixteen to eighteen per cent. in labor. The men realized that coal was absolutely necessary to keep industries going and to prosecute the war, and, notwithstanding the fact that the working force was made up of eighteen or twenty nationalities, they were loyally responding to the calls made.

The output of bituminous coal last year was about 544,000,000 tons, and of anthracite coal about 77,000,000 tons, but there should have been about 60,000,000 tons more bituminous coal to meet the needs, and as a result anthracite had been used to make up the deficiency, even to the extent of using domestic coal for steam purposes for industries.

The principal reason for the shortage was the overloading of transportation facilities by all kinds of freight. The maximum amount of anthracite was now being produced, and it could not be increased unless the mines worked double shift which was impossible through the labor shortage.

Waste of Coal in Mining.

Speaking on the waste of coal in Canada, W. J. Dick said a large proportion of the coal mined in Canada was lost and wasted through caving of measures owing to the practice of mining lower seams of better quality first, with the result that by the caving in, the recovery of coal from the upper seams was generally impossible. In other countries leases were granted only on satisfaction being given the authorities that a proper scheme of operations was to be carried on. In Canada there was indiscriminate leasing of coal lands without restrictions, and if the mines were worked to their capacity the output would be 16,000,000 tons per annum. He deprecated the opening up of farmer or "snowbird" mines, about 400 of which had been abandoned in Alberta alone, as they had only destroyed the entrance to a coal field for large operations and were a menace to safety in the workings. He suggested that slack coal should be made into briquettes if a cheap binder could be found.

Mr. White Defends Commission of Conservation.

James White, assistant to the Chairman of the Dominion Conservation Commission, accused the Canadian Mining Institute of sending to the Prime Minister a memorandum full of inaccuracies. He declared that unless there was an end to the "most scandalous and disgraceful attacks made on the Commission," he would have to place the matter before the Hon. Clifford Sifton, the Chairman, and raise a question of whether the Institute should continue to receive the grant from the Dominion Government. Mr. White denied emphatically that the work of the Department of Mines had been encroached on, and that it could never get the necessary funds to carry out the work which the Commission had been encouraged to undertake. He declared that from 1910 till 1916 \$770,000 had been turned back to the Treasury by the Mines Department as unspent, "yet the precious bulletin declared it could not obtain funds." The memorandum inferentially stated that power had been given the Commission by order in Council to appoint permanent officials or employees in the Civil Service; the veriest tyro knew that the Government could not abrogate its power in such a manner. He declared that the field work of the Commission in regard to mines and minerals had not aggregated one thousand dollars a year, and yet they were told they spent so much that the Mines Department had not the necessary funds.

As an indication of the good work done by the Commission, Mr. White said, they defeated the application for damming the St. Lawrence at the Long Sault by an alien corporation, and also an application under the guise of a canal charter, which, if granted, would have alienated to a corporation all the water-power of the Pigeon, Rainy, Winnipeg and Saskatchewan Rivers, between Lake Superior and the Rocky Mountains. A flood of other water-power legislation was withdrawn after that.

Mr. White said he did not think there was any man with the brain of a hen who could have written some of the statements contained in the memorandum. He asked the Institute to pass a resolution of regret.

The Chairman stated that the incoming Council will deal with the matter, and the meeting accepted this ruling.

Election Results.

The result of the ballot for the President and two Vice-Presidents was announced as follows: President,

D. B. Dowling of the Geological Survey, Ottawa; Vice-Presidents, H. E. T. Haultain of Toronto and J. A. Dresser of Montreal. As the election of Mr. Dowling leaves a vacancy in the Vice-Presidents, O. E. S. White-side was unanimously elected to the position.

Councillors elected by acclamation were: Alfred Stansfield, Montreal; N. R. Fisher, Haileybury; R. E. Hore, Toronto; E. P. Mathewson, Toronto; S. B. Wright, Deloro; Jules Charbonnier, Blairmore; W. P. Williams, Bellevue; R. H. Stewart, Vancouver; Geo. Wilkinson, Victoria; W. R. Wilson, Fernie.

THE MINISTER OF MINES ADDRESSES C.M.I.

The Secretary of State and Minister of Mines, the Hon. Martin Burrell, told members of the Canadian Mining Institute at their annual banquet, that it was not his intention to attempt to introduce any new Mining Act during the coming session. He believed that the whole attention of the Union Government should be devoted to doing everything possible to help win the war, and to avoid any legislation which might be of a controversial character. The expression of this sentiment was warmly applauded, despite the fact that there had been drafted what many considered an ideal mining act.

Mr. Burrell dealt at length with the relation of the Government of the country to the people, and said that the attitude of many had changed regarding the part a Government should play in connection with industries. It was possible that before the war was over the Government of the day would take a large step in advance and nationalize certain forms of industry rather than leave them in private hands. He would, however, be reluctant to think that any form of Government or any development of Canadian national life should proceed to nationalize in such a way that it would stop that wholesome strong stimulus of private enterprise and energy that had done so much to build up the country.

Some people had suggested that Government should be by experts, but he rather subscribed to George Russell's pregnant saying, that experts should be on tap and not on top. It would be a foolish minister who did not do everything in his power to encourage specialism and be ready to be guided by expert advice when it was clear that expert advice was needed.

The Memorandum.

Referring to the memorandum submitted by the Institute to the Premier, and about which there had been some strong things said at the convention of the Institute that morning by a member of the Commission of Conservation, the Minister of Mines said it contained some pretty vigorous and sweeping criticism; but while not discussing them in detail, he was willing to subscribe to the spirit which had prompted them. He agreed that the mining industry would not only play a large part in the war, but would be of great importance in the vast reconstructive period which must follow. No man could avoid the conviction that some of the enormous problems that would face this country in the period subsequent to the war would be little less difficult than the problems of war itself. He did not see how the taxation of the country could be much less than it was to-day, and there would be the greatest necessity for stimulation and development in every conceivable way of every pound of national resources, including the brain and brawn of the citizens of the country.

Canadians had so to develop their resources that there would not be a transient development in war time but a strengthening and perpetual development in times of peace. With reference to the charge that there was

overlapping in the two branches of mines and geological survey, and that there had been such frequent changes of ministers that none stayed long enough to follow out any policy of continuity, he said that there must in every large governmental department be a certain amount of duplication but that it should be the duty of the ministers to eliminate this overlapping. The work should be correlated as far as possible and the money devoted to it directed to the proper channels, where it would be utilized in the public interest. As long as he was Minister of Mines he would give sympathetic and constant attention to the department. People must never lose sight of the paramount duty of carrying on the exploratory work on which all mining was based.

There were big problems facing the country, immense sums of money had been spent on the Hudson's Bay Railway, the wisdom of which had been questioned, but although it was to some extent a political railroad, he believed it would be of immense value from the mining point of view, as it rendered accessible to those doing exploring work a vast hinterland which might prove to be one of the greatest national assets of the future.

He hoped also to extend the valuable system of laboratories that existed at Ottawa to British Columbia, believing that they would not only help to solve immediate problems, but would give an immense stimulus to the country. Further east there were other problems, such as the lignite beds of Saskatchewan and Manitoba, and whatever the opinions held by experts of opposing schools, he maintained that if it was possible to provide for a better utilization of large bodies of material which constituted big national resources and which, in the conversion of their by-products could be of immense national benefit, then it was the duty of the Government to make an intelligent investigation and seek a solution of the problems.

Utilization of Peat.

Touching on the utilization of peat as fuel, Mr. Burrell stated that he had been studying the question for the past few weeks and was firmly convinced that something could be done to put the peat industry on an economical basis, and make accessible 120 000 000 tons of material which would be a valuable subsidiary fuel in this country. As a result of investigations, the authorities had come to fairly definite decisions in the matter and he hoped something would be done during the present session to carry on investigational and experimental work that would perhaps remove public scepticism.

Other Speakers at Banquet.

Bradley Stoughton, secretary of the American Institute of Mining Engineers, spoke of the part being played by the engineers of the United States in assisting the Government in its war work through different departments, and paid warm tribute to the heroism of the Canadian troops.

H. H. Vaughan, president of the Canadian Society of Civil Engineers, congratulated the institute on forming an iron and steel section and said that there was no need for conflict between the engineers and the mining institute as each should play its part and co-operate in the development of industry.

The president of the Mining Society of Nova Scotia D. A. Macdougall, also spoke, remarking that he believed that at the forthcoming meeting of that society a proposal would be submitted for affiliation with the Canadian Mining Institute, thus placing the latter body in a position to speak authoritatively for the whole mining industry of Canada.

At the concluding session of the Institute in the afternoon, a resolution was passed in favor of the daylight saving plan. B. Neilly, of Cobalt, was elected vice-president in place of O. E. Whiteside, who had been elected in the morning, but who had tendered his resignation from the office, feeling that the West was already sufficiently represented in the council of the Institute. A number of the members paid a visit to the Armstrong Whitworth plant on the South Shore during the afternoon.

A Collection of Tin Specimens

The Ontario Bureau of Mines has recently received from Mr. J. D. Millen, general manager of the Mount Bischoff Tin Mining Company, Tasmania, Australia, a very interesting collection of tin ores. There are in all about thirty-five specimens of ore and rock, and five samples of concentrates from the mill. Included in the collection are several very fine nuggets of water-worn cassiterite (SnO_2). The primary ore, as distinguished from the surface alluvial deposits, is innocent-looking enough. It would undoubtedly be passed over by most Canadian miners and prospectors. There is no geological reason why commercial deposits of tin may not be found in Canada, and for that reason the Bureau of Mines will be very glad to show these ores to anyone interested. As a matter of fact, very small quantities of cassiterite are already known to occur in the Yukon, British Columbia, Ontario, Quebec, New Brunswick and Nova Scotia.

It may be recalled that the tin occurrence at Mount Bischoff is the most important in Australia. The rocks on Mount Bischoff have been described as consisting of Paleozoic slates and quartzites with some sandstone and dolomite. These sediments are intersected by quartz-porphyry dikes. The dikes on the upper part of the hill are greatly altered, the original constituents, with the exception of zircon, having been decomposed. In the altered part of the dikes, a great variety of minerals have been introduced, including topaz, tourmaline, quartz, siderite, cassiterite, arsenopyrite, pyrite, pyrrhotite and fluorite. Most of the ore occurs in the quartz-porphyry dikes, and only to a minor extent in the Paleozoic slates.

In the early days, the mining was confined to the detrital or gravel deposits, which lie on the surface, and which are regarded as alluvial; these were very rich.

Mining commenced in the early seventies, the principal company, the Mount Bischoff Tin Mining Company, having distributed in the first thirty years of its activities ten million dollars in dividends.

It is to be hoped that, in the near future, Mr. Millen, who has made a very careful and detailed study of the Mount Bischoff deposits, will present a paper before some of our technical societies on the results of his investigations.

MR. GODSON'S WORK APPRECIATED.

The Daily Nugget of Cobalt speaks very warmly of the work of Mr. T. E. Godson, Mining Commissioner of Ontario. Referring to him in a recent issue, it says: "To Mr. Godson the prospectors and mining men of Northern Ontario indeed owe a debt of gratitude. His latest request that the fighting men of the country be extended every consideration and protection possible is but in accordance with his usual just policy."

INCIDENTS OF C.M.I. ANNUAL.

The Memorandum.

The now famous Memorandum, prepared by a committee of Council of the Institute and presented to the Prime Minister two or three weeks ago, received its due share of attention at the meeting. It was discussed at White heat in one of the sessions, and formed the text for a considerable part of the Minister of Mines' brilliant speech at the annual dinner.

The Major and the Maid, or Camouflage at the Smoker.

(J. W. E. an attractive "female" sauntering in his wife's clothes in the hallway near the entrance to the Smoker, catches the eye of the Major and instinctively draws him towards "herself.")

J. W. E.—"Were you at the war, sir?"

The Major (in most respectful and earnest tones) "Yes, ma'am, eighteen months."

(Then disclosure of indentivity by J. W. E.)

Coal and Briquettes.

Overheard in the rotunda after the animated debate on coal briquettes; the first conceived but yet unborn offspring of the H.A.C.S.I.R. "I say, old man, if you have any financial interest in coal, developed or undeveloped, between the boundless plains and the wide Pacific, you are a fakir and a grafter, and to use a Sunday School expression, there is no health in you. Go off and sit down, and let not your voice be heard in connection with fuel. Eh what! Weren't you told so?"

Another Case of Mistaken Identity.

The Chairman of Smoker (in rapid fire, stirring tones during a lull in the proceedings). "Gentlemen, I understand we have the honor to have with us tonight Mr. Donnelly, inventor of the unsinkable ship. We shall be pleased if he will come to the platform and address us on a subject that is of great interest to the Allies and to the world in general."

John Donnelly, our most successful raiser of sunken ships, sitting in the southeast quarter of the room, surrounded by a group of Queen's men as usual, immediately "takes notice" and wonders what kind of stunt is to be pulled off on him. Those surrounding him also think the joke is now to be on him and raise a loud laugh. In the meantime, a stranger to the audience rises in the northwest quarter and approaches the chairman. He ascends the platform, and proves to be Donnelly, the inventor, of Washington, D.C., and other parts of the coast. In beginning his address he is somewhat flurried as he thinks the audience is laughing at his ship. Sinkable and unsinkable! But then Ignatius Donnelly, now gathered to his fathers, achieved fame by asserting that Bacon was Shakespeare, and vice versa.

The Institute's Twentieth Birthday.

The youth has reached manhood's estate. He is in khaki and can vote. His teething-measles-mumps stage bothered him but little. He was a robust infant. His parentage was good. The years have dealt lightly with many of those who were present at his birth. His godfather, the first president of the Institute, is still "one of the boys." G. R. and F., other past-presidents, prove that a youth spent according to Spartan laws defies time and that twenty years in their case mean but little. J. S. B. is just as lively on a St. Andrews night, when the haggis is borne aloft, or when he is enticing the wily trout in Laurentide streams, as he was in '98. But many of the best are gone. Bell and Leckie and Hay, and the younger Fraleek and LeRoy. What good fellows they were!

THE COMMISSION OF CONSERVATION.

At the Friday morning session of the meeting of the Canadian Mining Institute, Mr. Jas. White, assistant to the chairman of the Commission of Conservation, proposed a resolution expressing the regret of the Institute that the memorandum contained serious errors of statement respecting the Commission of Conservation, which were set out in detail.

The motion was seconded by W. J. Dick, who stated that, as a member of the council, he had not seen the memorandum, which was drawn up by a committee. Had he seen it he could have pointed out the errors.

The Chairman ruled that the matter was one which must be dealt with by the council, and no doubt the incoming board would make any corrections that should be made.

Mr. White maintained it was a question of right or wrong and should be decided by the meeting. A serious wrong had been done in a document distributed from coast to coast and his resolution called for a contradiction of the misstatements. He did not care a rap for technicalities or points of order, he stood for right and justice and he wanted to know if he was going to get it.

The Chairman: You will get right and justice, but I don't think this meeting is the place for that motion. If the meeting wishes to put aside my ruling they can do so.

Dr. Goodwin said the statements needed to be investigated, and if the memorandum was incorrect and unjust, the wrong done should be remedied. But the council should investigate it, and the meeting should not be asked to pass a resolution without investigation. He moved the matter be referred to the council for consideration and action.

Mr. White: Every statement I have made is contained in public documents, and I can demonstrate them right here. I never thought there was any man with the brain capacity of a hen, who would write some of the statements contained in that memorandum.

Dr. Goodwin: Even a murderer caught red-handed is not hung without a trial.

Mr. White: I did not know this was a criminal trial—it is a question of whether the meeting is going to back up these misstatements or not.

The Chairman: I may be wrong, but I have given my ruling, and it is for the meeting to say whether that is upheld. I am sure the council will take action and see that any inaccuracies or misstatements or any false statements will be corrected and proper means taken to see they are put before the proper authorities so that there will be no misunderstanding as to their meaning.

The motion to refer to the incoming council was seconded by A. G. Burrows, Toronto, and was carried.

BIG RAIL ORDER.

Ottawa, March 11.—An order for 100,000 tons of steel rails, or enough to lay tracks on some 800 miles of railroad, has been placed by Hon. J. D. Reid, Minister of Railways, on behalf of the Government, with the Dominion Iron and Steel Company. The rails are to be manufactured at the company's plant at Sydney, Cape Breton, and all are to be delivered by the end of July next. Rolling will begin on April 1st and it is hoped that during April 10,000 tons can be ready for use in making replacements on Canadian railways. In May, June and July it is expected that the rail mill will be producing up to its full capacity, and

that deliveries will reach 30,000 tons a month. The rails will be heavy ones, probably 85 pounds to the yard, and will be suitable for renewals on railway main lines.

Preliminary Report on Production in 1917

(Extracts from a preliminary report published by the Department of Mines, Ottawa.)

By John McLeish.

(Continued from March 1 issue.)

Coke.

The total output of oven coke during 1917 was 1,231,865 short tons made from 1,978,893 tons of coal, of which 1,379,038 tons were of domestic origin and 599,855 tons imported. The total coke used, or sold by producers during the year was 1,245,862 tons valued at \$6,713,073, or an average of \$5.39 per ton. In 1916 the total output was 1,448,782 tons and the quantity sold by the producers was 1,469,741 tons, valued at \$6,049,412, or an average of \$4.19 per ton.

By provinces the output was: Nova Scotia 645,069 tons, a decrease of 8,767 tons; Ontario 375,014 tons (all from imported coal), a decrease of 77,488 tons; Alberta 31,196 tons, a decrease of 11,352 tons; and British Columbia 180,586 tons, a decrease of 119,310 tons.

The ovens operated during the year were those at Sydney and Sydney Mines, N.S., Sault Ste. Marie, Ont., Coleman, Alta., and Fernie, Michel and Union Bay, B.C.

At the close of the present year 1,657 ovens were in operation and 875 were idle.

The exports of coke in 1917 were 23,595 tons valued at \$137,318, as against 48,539 tons valued at \$221,334 in 1916. The imports of coke in 1917 were 970,106 tons valued at \$6,517,260 as against 757,116 tons valued at \$3,229,078 in 1916.

Recovery of By-Products.

Of the total output of coke 914,466 tons, or 74 per cent. was made in by-product recovery ovens and the recovery of by-products included: Ammonium sulphate 9,941 tons, and tar 8,277,078 gallons, as against 11,040 tons of sulphate of ammonia and 9,012,202 gallons of tar in 1916. There was also an important recovery of benzol, toluol, naphtha and naphthalene.

Fluorspar.

High prices have stimulated the mining of fluorspar at Madoc, Ontario, and production has increased from 1,284 tons valued at \$10,238, or an average of \$7.97, to 4,249 tons valued at \$68,756, or an average of \$16.08 in 1917.

There is an annual consumption of fluorspar in Canadian steel furnaces of from 10,000 to 15,000 tons.

Graphite.

The production of graphite in 1917, which was 3,714 tons valued at \$402,892, included 541 tons valued at \$106,305, or \$196.50 per ton, from Quebec and Baffin Island and 3,173 tons valued at \$296,587, or an average of \$93.47 per ton from mills in Ontario.

Graphite operators reported that of the total shipment 3,510 tons valued at \$372,167 were sold for export. The Customs records show exports of plumbago, crude ore, and concentrate, 112 tons, valued at \$7,455, and manufactures of plumbago valued at \$384,505.

It is of interest to note that a small shipment of high grade graphite was made during the year from deposits which were worked by the Hudson's Bay Company in the vicinity of Lake Harbour on Baffin Island. This graphite was sold to the Dominion Crucible Company at St. Johns, Que., who confirm the opinion of the Hud-

son's Bay Company that this graphite is of very high quality and comparable with the best Ceylon product.

Gypsum.

The total quantity of gypsum rock quarried in 1917 was 365,959 tons, of which 97,667 tons were calcined. The shipments of all grades totalled 339,418 tons, valued at \$887,170 and included lump, 226,846 tons, valued at \$251,960; crushed, 32,305 tons, valued at 51,869; fine ground, 4,843 tons, valued at \$19,222, and calcined, 75,424 tons valued at \$564,119. By provinces the shipments were: Nova Scotia, 218,588 tons valued at \$306,447; New Brunswick, 38,556 tons, valued at \$191,631; Ontario, 48,947 tons, valued at \$130,138; Manitoba, 33,347 tons, valued at \$258,934.

In 1916 the quantity quarried was 424,431 tons, of which 94,414 were calcined. The shipments included: Lump, 249,893 tons; crushed, 15,680 tons; fine ground, 6,096 tons, and calcined 71,246 or a total of 342,915 tons valued at \$738,598.

Exports of crude gypsum were 224,423 tons, valued at \$245,182, and of gypsum or plaster ground valued at \$146,384. The corresponding exports in 1916 were crude gypsum, 221,234 tons, valued at \$252,476, and gypsum or plaster ground valued at \$154,630.

The imports of gypsum of all grades during 1917 were valued at \$35,460 and included: Crude gypsum, 64 tons, valued at \$999; ground gypsum, 282 tons, valued at \$5,355, and plaster of Paris, 3,101 tons, valued at \$29,106. The total value of imports in 1916 was \$43,291.

Magnesite.

The production of magnesite was confined to the deposits in Argenteuil county, Quebec. The shipments in 1917 were 58,090 tons, valued at \$728,275 and include crude ore, calcined magnesite (burnt in the lime kilns) and dead burnt clinker (sintered in rotary kilns after mixture with about 5 per cent of magnesite). The crude ore was sold at about \$10 per ton, the calcined at \$28.50, and the clinkered, or dead burned material at from \$40 to \$46 per ton. The shipments in 1916 were 55,413 tons valued at \$563,829, or an average of \$10.17 per ton, and 14,779 tons valued at \$126,584, or an average of \$8.56 per ton in 1915.

Petroleum.

The production of crude petroleum in 1917, while about 7,000 barrels greater than in 1916, was less than the production of any other previous year for which records are available. A bounty of $1\frac{1}{2}$ cents per gallon is paid on the marketed productions of crude oil from Canadian oil fields, the administration of the "Petroleum Bounty Act" being under the Department of Trade and Commerce. According to the bounty record the production in 1917 in Ontario and New Brunswick was 205,332 barrels (8,186,614 imperial gallons). The average monthly price for crude oil during the year was \$2.33 $\frac{1}{4}$ at which rate the total production would be worth \$478,937. There was also a small production of crude oil in Alberta of which record has not yet been received. The specific gravity of this oil is below the standard specified in the "Petroleum Bounty Act" and no bounty is therefore paid thereon. According to press report based on inland revenue inspection records there was a recovery during the year from Alberta crude oils of 270,000 gallons of gasoline and refined illuminating oils.

The total production of crude oil in 1916 (exclusive of Alberta) was 198,123 barrels valued at \$392,284 compared with which the 1917 production shows an increase of about 3.6 per cent. in quantity but of over 22 per cent. in total value.

The price of crude oil at Petrolia was quoted at \$2.08 per barrel at the beginning of the year and was increased by 10 cents on January 8, 5 cents on January 30, 5 cents on April 16, and by 20 cents on August 20, running at \$2.148 throughout the balance of the year. The average monthly price for the year was 2.33 $\frac{1}{4}$ as against an average price of \$1.98 in 1916 and \$1.395 in 1915.

The Ontario production in 1917 was, according to the records of the Department of Trade and Commerce at Ottawa, 202,991 barrels. The production in barrels of the various fields as furnished by the Supervisor of Petroleum Bounties at Petrolia, was as follows, in barrels: Petrolia and Enniskillen, 74,267; Oil Springs, 46,902; Sarnia Tp., 4,493; Moore Tp., 6,282; Plympton Tp., 579; or a total for Lambton of 132,523 barrels; Bothwell, 29,682; Tilbury, 10,041; Dutton, 2,941; Onondaga, 382; Moza Tp., 20,998 and Thamesville, 6,420. The Bounty Supervisor states that "A new, extensive oil field at North Glencoe in the Tp. of Moza, in the County of Middlesex, has created a great deal of interest among oil producers and has already produced about 21,000 barrels."

This new production has offset a continued falling off in the production from the older fields.

The production by districts in 1916 was: Lambton, 142,208 barrels; Bothwell, 33,856 barrels; Dutton, 2,851 barrels; Tilbury, 16,296 barrels; Onondaga and Belle River, 1,663 barrels.

The production in New Brunswick, according to bounty records was 2,341 barrels in 1917 as against 1,345 barrels in 1916 and 1,020 barrels in 1915.

Exports of petroleum entered as crude mineral oil in 1917 were 2,130 gallons, valued at \$183, and of refined oil 28,212 gallons valued at \$6,558. There was also an export of naphtha and gasoline of 24,304 gallons valued at \$7,419.

The total value of the imports of petroleum and petroleum products in 1917 was \$21,455,326 as against a value of \$14,705,323 in 1916.

The total imports of petroleum oils, crude and refined, in 1917, were 378,224,746 gallons, valued at \$21,239,347. These oil imports included: Crude oil for refining, 183,105,102 gallons valued at \$8,411,730; petroleum and gas oils 142,455,582 gallons valued at \$4,521,854; and illuminating oils, 13,457,096 gallons, valued at \$1,093,560; lubricating oils, 5,315,811 gallons, valued at \$1,209,930; gasoline, 15,369,172 gallons valued at \$3,293,760, and other oils, products of petroleum, 18,521,983 gallons, valued at \$2,708,513. The imports of petroleum products included 1,620,634 pounds of paraffin wax valued at \$140,722, and paraffin wax candles 513,339 pounds, valued at \$75,257, or a total value of \$215,979.

The total imports of petroleum oils, crude and refined, in 1916 were 292,426,121 gallons, valued at \$14,604,476. The imports of paraffin wax and wax candles were 1,281,376 pounds valued at \$100,847.

Pyrites.

The total shipments of pyrites as sulphur ore in 1914 were 403,243 short tons valued at \$1,586,091 and containing a total sulphur content of 150,896 tons, or an average of 37.4 per cent. The average sulphur content varied among the shipping mines from 34.5 per cent. to 46 per cent. By provinces the shipments were: Quebec, 122,822 tons, valued at \$501,111; Ontario, 274,712 tons, valued at \$1,056,435; and British Columbia, 5,709 tons valued at \$28,545. Of the total shipments, about 341,676 tons, or 85 per cent, were exported to

the United States, according to producers' reports, the sulphur content of which was 126,106 tons.

The 1916 shipments of pyrites were 309,251 short tons, containing 116,980 tons of sulphur, or an average of 37.8 per cent., the increased production in 1917 being 93,992 tons, or 30 per cent. By provinces the shipments were: Quebec, 130,639 tons; Ontario, 177,552 tons, and British Columbia, 1,060 tons.

The Customs record shows exports of pyrites during 1917 as 279,646 tons, valued at \$974,200. Apparently the exports of copper pyrites from Quebec are not included in this record. Exports of sulphuric acid during 1917 were 18,955,100 pounds, valued at \$197,888, as against 3,151,700 pounds valued at \$74,527 in 1916. Imports of brimstone, or crude sulphur, in 1917, were 82,445 tons, valued at \$1,515,309 and in 1916, 73,467 tons, valued at \$1,186,618. Imports of sulphuric acid in 1917 were 216 tons valued at \$15,680, as against imports in 1916 of 2,403 tons, valued at \$115,173.

Salt.

The Canadian production of salt is still obtained entirely from southern Ontario and the yearly output has been slowly though steadily increasing. Total sales in 1917, including the salt equivalent of brine used for chemical manufacturing were about 138,909 tons, valued at \$1,047,792 as against 132,903 tons, valued at \$717,653 in 1916. These values are, as far as possible, exclusive of packages. The value of packages used in 1917 was \$403,879 and in 1916, \$309,603. By grades the production included: Table and dairy, 34,252 tons; common fine, 65,117 tons; common coarse, 37,398 tons; and land salt, 2,142 tons. The production by grades in 1916 was: Table and dairy, 35,045 tons; common fine, 54,596 tons; common coarse, 41,259 tons, and land salt, 2,003 tons.

The exports of salt in 1917 were 8,643 tons valued at \$94,364. The imports of salt were 170,810 tons valued at \$1,088,205 and included 44,973 tons of fine salt in bulk valued at \$184,792; 12,293 tons of salt in packages valued at \$120,665; and 113,544 tons of salt imported from Great Britain for the use of fisheries, valued at \$782,748. The total imports in 1916 were 101,208 tons valued at \$694,835.

Structural Materials.

The total value of the production of structural materials including cement, clay products, lime, sand and gravel, stone quarries, etc., for the year 1917 was \$19,102,571, an increase of \$1,635,385, or 9.4 per cent. over the 1916 value. This is the first increase in production of this class of products that has been recorded since 1913. The total having been \$17,467,186 in 1916, \$17,920,759 in 1915 and \$26,009,227 in 1914.

Cement.

The total quantity of Portland cement sold, or used in 1917 was 4,768,488 barrels of 350 pounds each valued at \$7,699,521 or an average of \$1.61 per barrel, as compared with 5,369,560 barrels sold, or used in 1916 valued at \$6,547,728 or an average of \$1.22 per barrel showing a decrease in quantity of 601,072 barrels or 11.2 per cent., but an increase in total value of \$1,151,793, or 17.6 per cent.

The total quantity of cement made in 1917 was 4,987,255 barrels, as compared with 4,753,033 barrels, an increase of 234,222 barrels or 4.9 per cent. Cement mills were slightly more active in 1917. The output was sufficient to increase stocks during the year by about 220,000 barrels whereas in 1916 the output was less than sales and stocks were drawn upon to the extent of about 620,000 barrels.

The total imports of cement in 1917 were 30,031 cwt. equivalent to 8,580 barrels of 350 pounds each valued at \$19,646, or an average of \$2.29 per barrel as compared with imports of 20,596 barrels valued at \$31,621, or an average of \$1.54 per barrel in 1916.

The total consumption of cement, therefore, neglecting a small export, was 4,777,068 barrels as compared with a consumption of 5,390,156 barrels, showing a decrease of 613,088 barrels, or about 11.4 per cent.

MURCHISON MEDAL AWARDED TO J. B. TYRRELL.

At the annual meeting of the Geological Society of London, held in London, England, on the 15th of February last, the president presented the Murchison Medal to J. B. Tyrrell, Mining Engineer, of Toronto. In making the presentation, he said in part:

"The Murchison Medal has been awarded to Mr. Joseph B. Tyrrell in recognition of the value of his many services to geological science. In the breadth of their scope, in the pioneer element which has so largely entered, in the practical benefits which have often followed, those services may stand as typical of Canada's contribution to Geology.

"During more than thirty years Mr. Tyrrell has been frequently engaged in exploring wide tracts of the little known lands of Northern Canada, making numerous prolonged journeys of a kind which demands no ordinary resolution and endurance. Besides thus adding largely to geographical knowledge by his own efforts, he has done much to make known the results of earlier explorers in the North. While helping very materially to develop the mineral resources of the Dominion, he has at the same time gathered much valuable information touching the older rocks of the region; and, uniting in his own person the geologist and the prospector, he has often shown by example how science and enterprise may go hand in hand, to the great advantage of both.

"On the side of pure science, however, his most notable researches have been made in the domain of Glacial Geology, where his wide acquaintance with the country has enabled him to arrive at conclusions of a large order. Prior to 1894 it was generally held that the ice which once overspread Canada, east of the Cordillera with its mountain-glaciers, emanated from a single centre of dispersal. Mr. Tyrrell first demonstrated the existence and approximate limits of a great ice-sheet, which he named the Keewatin, centring in the country west of Hudson Bay and distinct in origin from the Labradorean ice-sheet to the east. To these two he subsequently added a third, under the name of the Patrician Glacier, which had its gathering-ground to the south of Hudson Bay. His development of this thesis, involving a discussion of the relations in time and space of the ice-sheets radiating from different centres, must rank among the most important contributions to the Glacial history of North America.

"In forwarding to Mr. Tyrrell this token of recognition from the Council of the Geological Society, I beg, Sir, that you will add to our congratulations upon what he has already accomplished our hope that many years of activity still remain to him; and this wish will, I am sure, be echoed by his numerous friends on both sides of the Atlantic."

In Mr. Tyrrell's absence, Sir George Perley, High Commissioner for Canada, received the medal for him, acknowledging the honor in the following appropriate remarks:

"Mr. President and Members of the Geological Society: I am very happy to come here to-day and receive this medal on behalf of Mr. Tyrrell and I only regret that he is not here himself for that purpose. He was in London for some time last year; but, unfortunately, had to return to Canada last month, so that he has missed the pleasure of being with you to-day. As I live in Ottawa I have known Mr. Tyrrell for a long time. He is a native-born Canadian and was for many years connected with the Canadian Geological Survey. He showed much resource and energy in his work and it is very fitting that he should be recognized by your Society in this way.

"I may say that in our Dominion we are proud of our Geological Survey and of what it has done. We have a large country with great undeveloped mineral resources which the Geological Survey has done a great deal to help discover and utilize. Fortunately Canada has been able to assist more than could have been expected in providing minerals and metals during the war. Many supplies from enemy countries have been cut off and higher prices have encouraged enterprise. In consequence we have not only provided large quantities of nickel, but we have developed our copper, lead and zinc industries to a very considerable extent. Even so, I feel sure that our mineral and metal products will be greatly increased in the future and we believe that our resources in that direction have been hardly scratched. To exemplify this I would remind you that the wonderful silver deposits at Cobalt in Ontario were only discovered by chance, although lumbering had been carried on over that district for a great many years. The Ontario Government built a line of railway from the Canadian Pacific into the North country and in so doing crossed this great silver deposit, which is still producing heavily.

"As representing Canada, I am proud to receive this Medal on account of our Dominion, as well as on account of Mr. Tyrrell personally. It seems peculiarly appropriate at this time that this honor should be given by this old and important Society to a Canadian and we appreciate the same greatly.

"I accept the Medal on behalf of Mr. Tyrrell with grateful thanks, and it will give me much pleasure to forward it to him and communicate the very kind words with which you, Mr. President, have accompanied it."

THE UNSINKABLE SHIP.

Montreal, March 8.—The idea incorporated in the attempt made to render unsinkable the steamer Lucia, an Austrian vessel, taken over by the United States, came to its inventor, W. T. Donnelly, while building the dry-dock at Prince Rupert, B.C., he told the Canadian Mining Institute last night. The waste space in the Lucia is filled with buoyancy boxes.

Mr. Donnelly said at Prince Rupert he wanted to ballast the dock, and instead of putting stone in the bottom he experimented by placing a similar weight of wood on the wings of the dock, with the result that when pressure was put on the dock and it was driven lower into the water, the wooden ballast reversed its function and became additional buoyancy to such an extent that the dock was unsinkable.

Mr. D. B. Dowling, of Ottawa, has been elected president of the Canadian Mining Institute. Mr. H. E. T. Haultain, of Toronto, and Mr. J. A. Dresser, of Montreal, are elected councillors.

A Barytes Mine in Northern Ontario

Almost unknown to the Canadian public there has been developed by Premier Langmuir Mines, in Northern Ontario, a mine for the production of barytes, a mineral used largely in the paint and chemical industries.

The company owns 250 acres on the Night Hawk, a navigable river, in the Porcupine Mining Division, in what is known as the Night Hawk Lake area. A considerable portion of the property has been cleared and comfortable camps have been constructed for the workmen on the high ground overlooking the river.

The baryte occurs in a system of veins, one of which is shown in the accompanying illustration. Considerable development has been done, including the running

of a tunnel 100 ft. in length and the sinking of a shaft which is now under way. The ore in sight is remarkably pure and white.

A feature of this deposit that should not be overlooked is the fact that silver in both the native and sulphide forms is present in such amount as seems to warrant the hope that sufficient of this metal will be obtained to at least defray all operating costs.

The company is now at work on the equipment of a mill for the treatment of the ore, the buildings for which are now all completed, and are partially shown in one of the illustrations. All are covered with asbestos fire proof material.

Transportation from the mine to the Night Hawk river is provided for by a tramway, gravity being the only motive force required to carry the product to the barges of the company, by which it will be transported to Connaught Station on the T. & N. O. Ry., which will be the company's shipping point.

An Iron Industry for British Columbia

The subject of the establishment of an iron and steel manufacturing industry in British Columbia has lately been given much attention in Victoria and several less important towns on Vancouver Island, as, too, it had previously been considered in Vancouver. The present outcome of the numerous meetings and discussions, having as their chief object measures to utilize in the province the iron-ore resources of the Coast district, is that a committee representative of several public bodies has been selected to proceed to Ottawa with the purpose of seeking substantial aid from the Dominion Government to establish iron and steel works on the coast of British Columbia.

It seems to have been taken for granted by some of those prominent in this movement to endeavor to induce the Dominion and Provincial Governments to become financially responsible for the starting of an industry that heretofore no capitalists have shown themselves ready to undertake, that little dependable information is in the possession of the Dominion Government relative to the iron-ore resources of the British Columbia coast. The fact that investigations were made during recent years by Messrs. E. Lindeman, R. G. McConnell, C. H. Clapp, O. E. LeRoy, and other officials of the Canada Department of Mines, has either been ignored or was not known to those now advocating inquiry and investigation by the Dominion Government. Further, there is a wide discrepancy between statements made at meetings held recently on the British Columbia coast as to the quantity of iron ore known to be available and that estimated by men employed by either the Dominion or the Provincial Government to investigate the situation. For instance, one man claiming to be qualified to express a dependable opinion has been asserting that some 50,000,000 tons of iron ore is available on the British Columbia coast, against which there is the carefully prepared statement of Mr. W. M. Brewer, contained in a bulletin, published by the B. C. Department of Mines, on "The Iron-ore Deposits of Vancouver and Texada Islands," which comprise the chief known accessible deposits on the coast, that the "tonnage of ore available" is estimated by him at 12,888,200 tons, of which 470,000 tons is "actual ore," 4,537,600 tons is "probable ore," and 7,880,600 tons is "possible ore." Mr. Brewer made his investigations for the B.C. Department of Mines in 1916, as he stated in his report "principally for the purpose of bringing up to date the information regarding the iron ores already in the possession of the Bureau of Mines." In preparing his report, he had before him reports previously made for the B. C. Department of Mines by Mr. Herbert Carmichael and the Provincial Mineralogist, and those of Messrs. Lindeman, McConnell and Clapp, for the Canada Department of Mines. In addition, there were "reports from examinations made by mining engineers for private clients previous to 1910, which have not been published."

In March, 1917, there was submitted at a meeting of the Western Branch of The Canadian Mining Institute, held in Vancouver, a paper on "Opportunities for the Establishment of an Iron and Steel Industry in British Columbia." In the course of the discussion that followed, Mr. John M. Turnbull, who, after years of work as a field engineer for the Consolidated Mining and Smelting Co., is now professor of mining at the University of British Columbia, said, in part: "The difficulty in regard to ores is the problem of first import-

ance. I believe there are large quantities of magnetite ore on this coast, but we have no definite knowledge as to what quantity can be obtained and its probable average grade and character."

Mr. E. T. Hodge, professor of geology at the University of British Columbia, said, in part: "We hardly have a right to discuss questions of manufacture until we have settled the far more important matters of occurrence, quantity, availability, and smelting suitability of our iron ores. But, in view of the great ease of transportation from Vancouver to many Asiatic cities, we ought, with a proper supply of cheap iron ore, to become a manufacturing and distributing centre for iron machinery or other high-grade products. It has been stated that several of our iron deposits are suitable for smelting, but as scarcely any of these have been opened, we do not know to what geological type they belong and consequently cannot tell anything about their size or uniformity. We cannot, with advantage, build smelters until we have some definite idea as to tonnage, nor can we do so until we know the type of ore we have to treat. I think you will admit that, with the limited geological examination which our iron-ore deposits have received, except in a few instances, that we have only a faint idea as to the tonnage, and no conception as to the type of ores which a smelter would have to treat. Many of these facts must be known before we can plan definitely for a smelter and before we can interest capital in the manufacture of iron from our ores."

When the present session of the Legislative Assembly of British Columbia was opened recently, the Lieutenant-Governor, in the course of his address, said: "My Government is securing the services of an expert to advise on the electro-thermic treatment of iron ores, and measures for the encouragement of iron and steel industries will be presented for your consideration." In the address in reply, there occurs the following paragraph: "We warmly approve the action of the Government in securing expert advice on the electro-thermic treatment of iron ores, and we will give our best consideration to proposed measures for the encouragement of iron and steel industries." The member who moved the adoption of the address in reply, however, made the following comment on this subject: "Assuming that the Province possesses the iron-ore deposits and that conditions are favorable for the establishment of an iron and steel manufacturing industry, I doubt whether in going to Ottawa seeking assistance, this Province is doing the right thing. Here, on Vancouver Island, all the resources in generous abundance exist. Do not the people of British Columbia possess faith in themselves to develop their own wealth, especially in this time of Empire stress? I believe they do. Not alone would such an industry aid in winning the war, but would also build up the industrial development of the Province after the war is over, and especially to the end that industrial work may be available for the men on their return from the front. Why, in the face of the noble response for funds for the Victory Loan, the people of the Province could not also provide amply for industrial development, I do not know."

The delegates appointed to proceed to Ottawa have been told by the Vancouver Island members of the House of Commons that the Federal Government will likely ask them what evidence they have of a substantial industrial purpose on the part of the people of British Columbia in regard to the proposed iron and steel development, before any suggestion may be made as to the nature of the support it might give to such a

project. The suggestion that the Dominion Government undertake the business of development is quite out of the question. A concrete proposal will be required from the delegates. It was pointed out, too, that the labor situation in British Columbia appears to be a detrimental prospect which will have a bearing on the attitude of the Government. Also, the Government may require that it be given some definite information as to where a market is to be found for the products, should an iron and steel industry be established, as asked for.

The outcome of the movement is being awaited with much interest, but, meanwhile, no information has been made public indicating that capital is, or will be, available for the proposed undertaking.

WILL INVESTIGATE PEAT POSSIBILITIES.

Ottawa, March 11.—The Dominion Government and the Government of Ontario are to co-operate it is announced here, in comprehensive experimental work during the coming season in the possibilities of peat as a fuel. The question has been under consideration by the Recommendation and Development Committee of the Cabinet. Special attention has been given to it also by Hon. Martin Burrell, Minister of Mines, who has considered it with the technical officers of his department, with R. A. Ross, consulting engineer, of Montreal, who is a member of the Research Council, and with E. V. Moore, who constructed the first mechanical peat excavator built in Canada.

Toronto, March 12.—Wide powers to go ahead with the development of the fuel resources of Ontario are to be given the Government by legislation introduced in the House yesterday by Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines. The Minister announced that it was the intention of the Government to appoint either a Fuel Controller or a commission to investigate the fuel resources of the province. To provide the money necessary for such an investigation the Government already had had \$100,000 set aside in the supplementary estimates.

The Minister explained to the House that the development of peat resources had been a matter of conference between the Dominion and Provincial authorities. Economy in operation was desired and for that reason it was necessary to avoid over-lapping between the two Governments. As soon as a working basis had been agreed upon a start would be made. The Minister said that new equipment had been devised for manufacturing peat into commercial form, and that experiments would be made with it. He emphasized the importance of finding the best labor-saving devices, since, if labor had to be relied upon to a large extent, the cost of production would be too large to ensure the future of the industry.

Mr. A. A. Hassan has for an indefinite period discontinued operations at the Great Falls gold mine in Maryland and is now at 666 Mansfield Place, Brooklyn, N.Y. He will open an office in New York City. Mr. A. A. Hassan, Jr., has joined the U.S. Aviation Corps and is now a first Lieutenant and Instructor in Aviation at Gerstner Field, Lake Charles, Louisiana. Mr. Hassan's younger son, Ennis, has also volunteered for the U.S. Flying Division.

Mr. D. C. Bard, consulting engineer to the Ladysmith Copper Corporation, has been examining mining property on Quadra Island, of the Valdes group.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

On his return to Victoria, at the end of February, Mr. R. F. Green, who represents West Kootenay in the Dominion House of Commons, stated that during an extended trip he had made recently through that district, he had found business conditions in the chief centres generally fair, with the exception of Slocan and Ainsworth, where mining operations have been affected by the action of the Consolidated Mining and Smelting Company in enforcing a new schedule of charges for the reduction of silver-lead and lead-zinc ores at its smelting works at Trail. In those two divisions, a number of the mines have been closed. At the same time, conditions are now nearly normal at Trail and Rossland, where labor difficulties and a shortage of coke had for a time necessitated a suspension of operations. In the mines in Rossland camp, about 500 men are now employed, as compared with approximately 600 before the suspension of mining, while at Trail about 1,300 men are engaged at the smelting and refining works, against 1,500 before the strike that took place last November. The difficulties between the Slocan and Ainsworth mine-operators and the Consolidated Company relative to quantities of ore the company has announced it will accept for smelting and the higher scale of charges it has demanded, have been under discussion for some time. The advisability of having a Federal investigation into the whole matter in dispute is being urged by the mine-operators. On the other hand, the smelting company is stated to be willing to submit its case for full consideration. Mr. Green expresses the hope that an amicable settlement of these difficulties will be reached.

In this connection, it may be mentioned that at the Northwest Mining Association's annual convention, held in Spokane, Washington, during the week of February 11-16, there was strong complaint made against the recent policy of the Consolidated Mining and Smelting Company, and bitter denunciation of what was asserted to be its intention to force the independent mine-operators out of the mining business in the West Kootenay district of British Columbia. To understand that the British Columbia mining men, who told of their present difficulties, occasioned largely by deferred settlements and increased charges, and of the discouraging prospects for silver-lead mining between much decreased returns from the smelting works and the considerable increase in taxation imposed by the Provincial Government, had a generally sympathetic audience, it should be remembered that by far the greater number of operating mines in the Ainsworth and Slocan mining camps have been in late years financed from Spokane, and that in a number of important instances, control of them is held in that city.

An example of the bad effect recent experience is having, may be found in the case of the Florence Silver Mining Company, with headquarters in Spokane, which company, after having for about six years steadily developed a mine in Ainsworth camp, in 1916-1917 erected and equipped a concentrator and entered on what it was planned should be a long period of production of silver-lead ore and zinc concentrate. On February 21, the Kaslo "Kootenayan" printed the following:

"We have been up against this sort of thing ever since we got in a position to operate our mill," said

President F. R. Wolfe, of the Florence Silver Mining Co., the other day, referring to the latest circular received from the Consolidated Mining and Smelting Company. "Last year, every time we thought we had things right and in shape, along would come some new circular from the Consolidated Company that would upset the whole kettle of fish. This last affair is the crowning outrage of all. Personally, I do not kick quite so much on the increase, which is bad enough, as on the mode of settlement for lead, which is worse. If I let them take our lead and stack it away awaiting the getting of a better market price, I can come pretty near to guessing that they will sell it for me at the lowest price they can get.

"If ever there was a time that the independent silver-lead producers of that region should organize, it is right now. If we do not, the only thing I can see is for us to pocket our losses and get out.

"The Consolidated Company has things fixed so that it costs about the same for ore treatment if the producer ship to American smelting works or if he ship to Trail. With the Florence mine, we can do nothing else but lose money on our ores, if we ship to Trail and pay short-haul transportation charges without customs duty, and the exorbitant demands of the Consolidated Company. If we ship to the United States and pay long-haul freight charges and customs duty, with lower smelting charges, then it figures out about the same. It is certainly very cleverly arranged.

"If the duty is taken off Canadian lead ores going into the United States, then we may be able to operate the Florence mine and mill at about an even break. It would help some, perhaps, to keep things going until we get the smelting rate question adjusted so that there would be more in the nature of a square deal for the independent producer."

A Mineowners' Association.—Incidentally, it is of interest to note that another attempt is to be made to put life into an organization, named the British Columbia Mineowners' Association, which was launched at Nelson several months ago, but in which the mine-owners and mine managers of Kootenay district have not yet taken much interest, the meeting called to complete organization having lapsed by reason of the smallness of the number attending at the time and place at which officers and committee were to have been chosen and other preliminaries carried out. The announcement calling another meeting at Nelson states that "those who have not yet joined the organization will be given an opportunity of doing so. It is imperative that every Kootenay mine should be represented at this meeting, as matters of the utmost importance to all silver-lead and zinc-ore producers will be dealt with; and more especially the present intolerable smelting situation, which has rendered mine operation almost impossible. If plans do not miscarry, a series of resolutions will be drawn up to be submitted to the forthcoming annual meeting of the Associated Boards of Trade of Eastern British Columbia, the endorsement of which body will be sought. One of these resolutions will urge the Dominion Government to suspend the free importation of lead and zinc ores into Canada until such time as the United States shall permit ores of a similar character to go into the United States free of customs duty, or, in other words, until such time as there shall be reciprocity between the United States and Canada in respect to these ores. Another resolution will demand the regulation of lead and zinc smelting works in Canada as public utilities, and will advocate such works being taken over by the Govern-

ment, if necessary, to ensure that Canadian smelting charges on similar classes of ore shall not in any case be higher than those of custom smelteries in the United States, realizing that Governmental action of this nature is absolutely necessary to conserve the mining industry of Canada and to stimulate the production of silver, lead and zinc ores from mines in British Columbia. A petition will also be prepared for presentation to the Dominion Government, along the lines indicated, such petition to be circulated for signature throughout the Province, with a view to obtaining legislative relief during the forthcoming session."

East Kootenay.

Published figures show the production of coal from mines in the Crowsnest district, Southeast Kootenay, to have been 75,162 long tons during the month of January, as compared with 35,698 tons in the corresponding month of 1917.

Production of ore from metalliferous mines in the district, as shown by receipts at the Consolidated Mining and Smelting Co.'s works at Trail during 52 days of 1918, to February 21, inclusive, was 11,058 tons. Of this total, 10,069 tons was zinc ore from the Consolidated Co.'s Sullivan mine, 113 tons lead-silver ore from its St. Eugene mine, 812 tons silver-lead ore from the Paradise mine in Windermere division, and 64 tons from several small shippers.

West Kootenay.

Ainsworth.—Only one mine in Ainsworth camp had shipped ore to Trail in 1918 up to February 21, namely, the Consolidated Co.'s No. 1 mine, which made an output of 916 tons of silver ore.

The Bell mine, in Jackson basin, in the western part of Ainsworth mining division, during the same period shipped to Trail 183 tons of zinc ore, and the Lavinia, situated north of the northern end of Kootenay Lake, sent in 32 tons of ore.

Slocan.—It is claimed that at no previous time in the history of mining in Slocan district have similar conditions prevailed, since a number of mines have ore to ship, but cannot find a market for it at remunerative rates. The year's receipts at Trail from Slocan mines, to February 21, have totalled only 1,998 tons, of which 967 tons was from the Surprise, which now has two concentrating plants, and 795 tons was chiefly zinc ore from the Lucky Jim mine. This left only 236 tons received at Trail during seven weeks from all other mines in Slocan and Slocan City divisions.

Nelson.—Work has been resumed at the Consolidated Co.'s Molly Gibson mine, at the head of Kokanee creek, in the northeastern part of Nelson mining division, and in the third week of February 147 tons of silver-lead ore from that mine was received at Trail. The Beasley-Monarch, situated about ten miles downriver from Nelson, has shipped two cars, 52 tons, of copper ore to Trail this year. The Emerald, near Salmo, in the southern part of the division, which in the latter half of last year opened a fine shoot of lead ore, is again shipping to Trail, receipts in recent weeks having totalled 138 tons.

Rossland.—The total quantity of ore received at Trail from Rossland mines in seven weeks ended February 21 was 29,083 tons, of which 1947 tons was from the Josie group of the Le Roi No. 2, Ltd., and the remainder from the Consolidated Co.'s mines, as follows: Centre Star-War Eagle group, 13,796 tons; Le Roi, 12,656 tons, and White Bear, 684 tons.

Boundary.

Both the Granby Company and the Canada Copper Corporation continue to operate smelting works at

Grand Forks and Greenwood respectively, but no particulars of quantities of ore smelted are obtainable. Both receive custom ores, but their main supply comes from mines operated by themselves.

Shipments of copper-gold ore from the Consolidated Co.'s Emma Mine, near Eholt, have this year reached Trail to a total of 5,613 tons to February 21.

Yale.

The output of coal from mines in Nicola Valley was 16,151 long tons for the month of January, which total is a little smaller than for the corresponding month of 1917.

Little productive metal mining is being done in this district at present. The only mine known to be making shipments of ore is the Iron Mask, near Kamloops, from which 540 tons of copper ore was received at Trail during four weeks to February 21.

Coast.

Production of coal from Vancouver Island mines was smaller in January of this year than in the corresponding month of 1917. Published figures give the output for last January as having been 139,442 long tons, as compared with 145,480 tons for January, 1917.

The following information concerning the Howe Sound Company, which owns the Britannia Mining and Smelting Company, was published lately in Seattle: "Much interest has been expressed regarding the 1917 earnings of the Howe Sound Company, but it is officially announced that particulars will not be available for publication until after the annual meeting, which will be held on March 18. During 1916, the Howe Sound Company produced 16,288,835 lbs. of copper and earned \$1,574,860. From official sources, it is learned that the company made no particular effort to increase production during 1917, preferring to devote considerable time and attention to increasing the ore reserves, which it is believed will be shown to have been about 5,000,000 tons greater at the end of 1917 than at the end of 1916. It is understood that the gross earnings during 1917 have been running ahead of the showing made in 1916, but, in view of the large amount of development work the company has carried out, net profits may not be quite as large as those of a year ago."

NORTHERN ONTARIO.

Geological Structure of Kirkland Lake Area.

The mine operators of Kirkland Lake are considering a plan whereby a general study of the geological structure of that area can be made. Sufficient underground work has been accomplished along the main auriferous zone to make possible a comprehensive estimate of the various faulting, dips and depths of various formations, and their relation to the mineral deposition. The Kirkland Lake area has now passed the prospective stage, with three mills in the camp now producing. It is interesting to note the rapid development which has taken place in the camp during the past two years, when the adverse conditions caused by the war had to be contended with. Whether or not the camp is to be a large one remains for the future to decide. The plan to make a comprehensive study of the geological structure of the district is an important one for the Kirkland lake camp. The two most vital necessities for the carrying out of this work, will be a mutual co-operation of the mine operators of the

camp in permitting access to their lower workings and the agreement upon a geologist whose selection will be unanimously endorsed by all the interested parties.

Tough-Oakes.

Operations at the Tough-Oakes mine at Kirkland Lake have recently been attended with highly satisfactory results. During the past week in the course of drifting on a large vein at the 350-ft. level of the mine, a new vein was encountered. The new vein where cut carries values as high as \$150 to the ton, but the general average of the whole vein is said to be about \$20 per ton. The composition of the vein resembles that of the other high grade veins in the mine and the gold appears in finely decimated particles sometimes visible to the naked eye and sometimes in the form of tellurides. This recent development is one of the most important at the Tough-Oakes for a considerable time. Working forces at this mine are better than for some time past, which fact coupled with the favorable results of development is making possible the feeding of the mill at almost full capacity, as well as the development of surplus ore. During the past year the dividends paid by the Tough-Oakes amounted to \$65,187, making a total to date of \$391,125. The ore reserves of the mine are large and the grade sufficiently high to permit of a fair margin of profit even under the adverse conditions which are being encountered by gold mining companies due to the high cost of material and the scarcity of labor. The auriferous zone so far developed consists of thirteen high grade veins, developments on which have not been carried below the 500-ft. level. However, the geological structure as so far determined strongly indicates a continuation of the veins to deeper levels, and the Tough-Oakes would appear to be in line for a prosperous future.

TORONTO MARKETS.

Cobalt oxide, black, \$1.50 per lb.
Cobalt oxide, grey, \$1.65 per lb.
Cobalt metal, \$2.25 per lb.

Mine Hoists

Made in 7 sizes, from 10 to 50 Horse Power, with one drum or two drums, any diameter desired. Supplied with Boiler, as shown, or without Boiler. Mine Hoists made also suitable for Electric or Gasoline Drive.

Catalogue on request.

MINE CARS and BUCKETS

We make and catalogue a great variety of Mine Cars, End Dump; Side Dump; Revolving, to dump either way. We list these in many sizes and for various gauges of tracks and at reasonable prices.

We are also open to make to order: Any Design of Mine Car or Bucket to Customer's Specifications.

Let us figure on your needs.

MINE SKIP for use on inclined tracks made any size and for any gauge track.

Oxy-Acetylene Welding and Cutting

Defective Forgings Are Rescued From The Scrap Pile.

Many manufacturers are throwing away a large portion of their earnings, and decreasing their profits, by allowing defective metal parts to be junked.

In a prominent drop forge works, forgings having minor defects are made perfect by the Prest-O-Lite Process of Oxy-acetylene welding. The forgings shown above are valued at \$1.50 each, and are reclaimed at a cost of a few cents.

For all metal manufacturing work and repairs—wherever two pieces of metal are to be joined—the Prest-O-Lite Process is usually the best and cheapest way.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

The Dominion Income War Tax

ITS MEANING AND APPLICATION

THE Dominion Income War Tax Act, passed at the last session of Parliament is now in force and all those liable to taxation under the provisions of the Act must file the required returns for the year 1917, on or before 31st March, 1918.

The Act provides that there shall be assessed, levied, and paid upon the 1917 income of every person residing or ordinarily resident in Canada, a tax upon income exceeding \$1500 in the case of unmarried persons and widows or widowers without dependent children, and upon income exceeding \$3000 in the case of all other persons.

Corporations and joint stock companies carrying on business in Canada, no matter how created or organized, shall pay the normal tax upon income over \$3000. The fiscal year of corporations and joint stock companies may be adopted if desired.

Your Immediate Obligation.—You are now required by law to fill out in triplicate, one or more of the five special forms enumerated below. Read the particulars about the forms provided, then note the form or forms that fit your case. Don't forget to make three copies. You keep one copy, and in the case of Forms T1 and T2, deliver two to the Inspector of Taxation for your district. In the case of Forms T3, T4 and T5, two copies must be filed with the Commissioner of Taxation at Ottawa.

Penalties.—Default in filing returns renders the person or persons liable on summary conviction to a penalty of one hundred dollars for each day during which the default continues. Any person making a false statement in any return or in any information required by the Minister of Finance shall be liable on summary conviction to a penalty not exceeding ten thousand dollars or to six months imprisonment, or to both fine and imprisonment.

FORMS TO BE FILLED IN AND FILED

Individuals.—Form T1 is for all individuals having the requisite income. Fill in pages 1, 2 and 3, make no marks on page 4.

In giving particulars of dividends received, state amount received from each company, listing Canadian and Foreign Companies separately.

Partnerships as such need not file returns, but the individuals forming the partnerships must.

Corporations and Joint Stock Companies must fill in Form T2, showing total income. Amount paid during the year to Patriotic and Canadian Red Cross Funds, and other approved war funds, should be shown under Exemptions and Deductions. A financial statement should also be attached. In giving particulars of dividends received, state amount received from each company, listing Canadian and Foreign Companies separately.

Trustees, Executors, Administrators of Estates and Assignees use Form T3, to state particulars of the distribution of income from estates they are handling. A separate form is required for each estate and total incomes must be given as well as distribution thereof.

Employers. On Form T4 employers shall make a list of the names of employees and amounts paid to each in salaries, bonuses, commission, or other remuneration wherever the combined sum of such remuneration for the calendar year 1917 amounted to \$1000 or more. This applies to all classes, regardless of number of such employees.

Corporations Listing Shareholders.—Corporations and Joint Stock Companies shall list on Form T5 Shareholders residing in Canada to whom Dividends were paid during the calendar year 1917, stating the amounts of dividends and bonuses paid to each.

Don't wait till the last minute. Get the necessary forms now, and make your information accurate and complete.

Forms may be obtained from the District Inspectors of Taxation and from the Postmasters at all leading centres.

*Postage must be paid on all letters
and documents forwarded by mail
to Inspector of Taxation.*

DEPARTMENT OF FINANCE

OTTAWA, CANADA

Who used the WILFLEY TABLE when Butte was a boom town?

Ask the oldest concentrator-man you know, what was the first successful table, and he'll tell you it was the

WILFLEY TABLE

The WILFLEY was in use in more than a score of mines when Butte was a boom-camp—and that was twenty years ago.

The WILFLEY is still the leading concentrator. The Wilfley engineers have kept ahead of development. Many improvements have been made in the mechanical construction, and the riffing systems have been improved to give increased capacity and cleaner separation. The No. 1623 and No. 10 riffing systems give unusually large capacity combined with close separation.

There is a WILFLEY to meet every requirement, from that of the ten-ton plant to the big mill using hundreds of tables.

The latest WILFLEY combines great capacity with extreme simplicity of design; has the improved head motion and riffles; easily adjustable wash-water and feed-box; improved tilting device; steel frame with slipper bearings; and new draw-bar which distributes strain over all three pressed-steel stringers.

Write for details, mentioning nature and tonnage of ore.

Following are some of the mills which have used WILFLEY TABLES

for nearly 20 years.

Caribou Mine	Boulder, Colo.
Tomboy Mine	Telluride, Colo.
Granite Bi-Metallic M. Co.	Phillipsburg, Mont.
Sunnyside Mine	Eureka, Colo.
Parrott Silver M. Co.	Butte, Mont.
Cornucopia Mine	Baker City, Ore.
Anaconda Copper Co.	Anaconda, Mont.
Detroit Copper M. Co.	Morenci, Ariz.
Des Loge Cons. Lead Co.	Des Loge, Mo.
Liberty Bell G. M. Co.	Telluride, Colo.
Silver Lake Mine	Silverton, Colo.
Guanajuato Cons. M. & M. Co.	Guanajuato, Mex.
Quincy M. Co.	Hancock, Mich.
Calumet & Hecla M. Co.	Calumet, Mich.
Wolverine Copper M. Co.	Houghton, Mich.
Arizona Copper Co.	Clifton, Ariz.

NOTE—They are still using the Wilfley as the most modern and up-to-date table.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

Applicants for publications not listed above should mention the precise area concerning which information is desired.

Maps published within recent years may be had, printed on linen, at the nominal cost of ten cents each.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

USERS of the Callow Cell are naturally interested in knowing how the decision of the United States Circuit Court of Appeals for the Third District, in the Miami case, will affect their interests.

As we understand the prevailing opinion of Judge Woolley in the Miami case he has interpreted the Supreme Court decision in the Hyde case as meaning that "*invention resides not alone in the critical proportion of oil, but also in air and agitation,*" and again, "*in the co-action of the critical proportion of oil and air effected by 'an agitation greater than, and different from that which had been resorted to before,' resulting in a froth concentrate of economical value,*" and further, that the Supreme Court did not limit the patent to "*agitation by mechanical means,*" but to agitation of a violent and persistent kind; "*it mixes the oil with the metal of the ore. This is old. Then, by its greater intensity and longer duration, it stirs the pulp into a froth.*"

Thus, this decision of the Third Circuit Court of Appeals has a most important bearing upon the art, because it holds that the mixing of the oil with the mineral is old, but it **leaves open the use of oil in connection with aeration-cells.** Meanwhile the idea of a "*critical*" proportion of oil has been dis-

proved by practice in several mills within a short time after it was promulgated.

Judge Woolley says further, concerning the Callow Cell: "*Aeration is direct, and is not the result of or caused by agitation. On the contrary, agitation results from aeration and such agitation, though present in some measure, is not even approximately of the violence and duration of the agitation of the patent. The operation in the Callow Cell certainly possesses these distinguishing features from operation of the process where aeration is caused by agitation.*"

The Court further confirms this important dictum by saying: "*If the only agitation to which the pulp was subjected (after such agitation as in the prior art was necessary to mix the oil and ore) was the agitation of the Callow Cells, we would not say that that agitation amounted to or was the equivalent of the violent agitation of the patent disclosure and constituted infringement.*"

Apparently users of the Callow Cell may feel assured they do not infringe the method of agitation described in U.S. Patent No. 835,120 (less than 1% oil), No. 962,678 (soluble frothing agents), No. 1,099,699 (phenol or cresol in the cold without acid) since all three of the patents are of the same process, dependent upon a certain degree of violence and length of agitation and the production of the same characteristic froth, as set forth in their claims.

(Signed) J. M. Callow.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

A corporation with sound financial backing is desirous of making examinations of copper properties either fully or partly developed with a view to purchase. Address Box B-3, c/o Doremus & Co., Advertising Agents, 44 Broad St., New York.

PATENTS TRADE MARKS AND DESIGNS PROCURED IN ALL COUNTRIES

Special attention given to Patent Litigation
Pamphlets sent free on application

RIDOUT & MAYBEE

Cor. YONGE AND COLBORNE STS., TORONTO ONT..

WANTED

To buy Jigs, Rolls, Con-
centrating Tables. Give
full particulars regarding
condition and price.

Address Box A, Canadian Mining
Journal, Toronto, Ont.

SMITH & DURKEE Diamond Drilling Co.

LIMITED

Contractors for all classes of dia-
mond drill work.

We make a specialty of saving a
large percentage of core in soft
ground.

Plans showing location of holes
and surveys of holes can be
supplied.

SUDBURY - ONT.

PRINTING AND PUBLISHING

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

SPEED IN THE "U. V. X." TUNNEL

With Sullivan "DR6" Drills

640 feet of heading were driven at the portal end of the "U. V. X." extraction tunnel, Jerome, Arizona, during December. 58 shifts were worked, an advance of 11 feet of 11 x 10 ft. heading (and bench) per shift.

The contractors are the Potter Construction Co. They have averaged 524 feet per month since July.

This excellent progress is accomplished with three Sullivan "DR6" Water Jet Hammer Drills. Holes 13 feet deep are drilled in the hard, tight conglomerate, and are shot with 60 and 40 per cent. blasting gelatine.

Described fully in *Mine and Quarry*
No. 634—Send for your copy.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

Class "EL-2" Air Compressor, Two-Stage Straight Line, with Intercooler, Powerful and Self-Contained.

Power-Driven, Two Stage Compressors

The type of Air compressor illustrated above is marked by great compactness, simplicity of installation, dust proof construction, automatic splash lubrication, and the lowest amount of attention required while running. With all these advantages there is com-

bined quick and easy access to all working parts, and high over-all efficiency is secured by ample intercooler surface and the use of "CIRCO" silent leaf valves.

Let us know your needs as regard compressed air equipment. Our long experience in this line is at your service.

Specifications and quotations will be promptly sent by any of our branches on request.

Conserve Your Man Power and Reduce Operating Expenses

The first is absolutely necessary from a patriotic standpoint—the second is the first thought of every successful business man. Both can be accomplished when you install the “New Cleveland” Stoper in your mine. It has speed, with staying power and efficiency, double that of any other drill on the market. It has lower operating expenses, because of its low air consumption, and its economy in repairs, through its drop forged parts of simple design which are practically unbreakable.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

THE INCOME WAR TAX ACT

Forms giving particulars of income for the year 1917, must be filled in and filed on or before the 31st March, 1918

Section 4 of the Act provides that all persons resident or ordinarily resident in Canada, shall pay a tax upon income exceeding \$1500 in the case of those single and widows and widowers without dependent children, and upon income exceeding \$3000 in the case of all other persons. It also provides that all Corporations and Joint Stock Companies, no matter how created, shall pay the normal tax upon income exceeding \$3000.

The Forms provided by the Department of Finance to be filled in with particulars of the 1917 income of all those whose incomes are liable under the Act, and by Trustees, Corporations and Joint Stock Companies, with information required of them, may be obtained from the District Inspectors of Taxation and from the Postmasters at all leading centres.

Forms to obtain and Special Features to observe

Individuals—Get Form T 1 to give particulars of their own incomes. In stating Dividends received, give the amount from each Company, listing Canadian and foreign Companies separately. Fill in pages 1, 2 and 3 only. Do not mark on page 4.

The following sample answers, (printed in *italics*) to questions asked on pages 2 and 3 of Form T 1, will help you to fill in correctly your copies of the Form.

PAGE 2. DESCRIPTION OF INCOME.

GROSS INCOME DERIVED FROM—

1. Salaries and wages.....	<i>None</i>
2. Professions and vocations.....	<i>None</i>	—
3. Commissions.....	<i>from sale of Real Estate</i>	\$1000
4. Business, trade, commerce or sales or dealings in property, whether real or personal.....		7500
5. Farming (Horticulture, dairying or other branches)	<i>None</i>	—
6. Rents.....		750
7. Dividends (A). Canadian Corporations—		
<i>Standard Transportation Company Ltd</i>		25
<i>Rainbow Mining Company Ltd</i>		150
(B) Foreign Corporations—		
<i>New York Trading Company</i>		15
<i>Albany Tool Company, Inc.</i>		60
8. Interest on notes, mortgages, bank deposits and securities other than reported in item 7—		
<i>Interest on Mortgages</i>		72
<i>Bank Interest</i>		21
<i>1200 Par Value Bonds of Jones Paint Co. Ltd.</i>		72
<i>1000 Municipal Debentures, Town of Midvale</i>		55
9. Fiduciaries, (Income received from guardians, trustees, executors, administrators, agents, receivers or persons acting in a fiduciary capacity)—		
<i>Income (not capital) from Estate of Andrew Doe (People's Trust Company, Executor)</i>		315
10. Royalties from mines, oil and gas wells, patents, franchises and other legalized privileges.....	<i>None</i>	—
11. Interest from Dominion of Canada Bonds, issued exempt from Income Tax \$3,000.....		150
12. Other sources not enumerated above—		
<i>½ Interest in Shaw Hardware Company Partnership</i>		750
13. Total Income.....		\$10,941

EXEMPTIONS AND DEDUCTIONS

PAGE 3

AMOUNT CLAIMED FOR—

14. Depreciation... <i>On Store Building (not land), (Brick)</i> ..	\$ 125
<i>On Equipment, used in business</i>	140
<i>Store Fixtures</i>	100
15. Bad debts, actually charged off within the year.....	40
16. Allowance for exhaustion of mines and wells... <i>None</i>	—
17. Contributions actually paid to the Patriotic and Canadian Red Cross Funds and other approved War Funds..... <i>Patriotic and Canadian Red Cross</i>	250
18. Interest paid on monies borrowed and used in the business..... <i>Mortgage on Store Property, \$1,000</i> ...	60
19. Federal, Provincial and Municipal taxes on property used in the business— <i>General Municipal Taxes</i>	180
20. Interest from Dominion of Canada Bonds, issued exempt from Income Tax.....	150
21. Other claims for deductions must be specified in detail— <i>Business Operating Expenses</i> <i>Repairs (stating particulars)</i>	4200 150
22. Total Exemptions and Deductions.....	\$5395
23. Amount paid under Business Profits War Tax Act, 1916, which accrued in the 1917 accounting period..... <i>Year ending December 31, 1917—None</i> .	

I hereby certify that the foregoing return contains a true and complete statement of all income received by me during the year for which the return is made.

Date.....*15th March, 1918*.

Signature.....*John Brown*.

Corporations and Joint Stock Companies. Use Form T2—giving particulars of income. Also attach a financial statement. Under Deductions, show in detail amounts paid to Patriotic Fund and Canadian Red Cross or other approved War Funds.

Trustees, Executors, Administrators of Estates and Assignees use Form T3. Full particulars of the distribution of income from all estates handled must be shown as well as details of amounts distributed. A separate Form must be filled in for each estate.

Employers must use Form T4 to give names and amounts of salaries, bonuses, commissions and other remuneration paid to all employees during 1917 where such remuneration amounted in the aggregate to \$1000 or over.

Corporation Lists of Shareholders.—On Form T5 corporations shall give a statement of all bonuses, and dividends paid to Share-

holders residing in Canada during 1917 stating to whom paid, and the amounts.

Penalties.—Default in filing returns renders the person or persons liable on summary conviction to a penalty of one hundred dollars for each day during which the default continues. Any person making a false statement in any return or in any information required by the Minister of Finance shall be liable on summary conviction to a penalty not exceeding ten thousand dollars or to six months imprisonment, or to both fine and imprisonment.

In the case of Forms T1 and T2, keep one copy of the filled in Form and file the other two with the Inspector of Taxation for your District. In the case of T3, T4 and T5, keep one copy and file the other two, with the Commissioner of Taxation, Dept. of Finance, Ottawa.

Forms may be obtained from the District Inspectors of Taxation and from the Postmasters at all leading centres.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

Reduce Your Haulage Costs With A PORTER

The safety, and efficiency of compressed air haulage have been brought to the highest standard in Porter Locomotives. To these we have added an economy in cost and upkeep that no man interested in mine haulage can afford to disregard.

Write for full details to-day.

CANADIAN H. K. PORTER CO, 1218 UNION BLDG., PITTSBURG, PA.

is the trade-marked name for pasteurized separated

ONTARIO MILK

in dry form. Government Inland Revenue Bulletin No. 257 states that separated milk powder "contains no adulterants," "is true to the claims made for it" and is genuine."

Klim is the most economical form of milk. It bulks smallest and weighs less than any other form of milk, thus effecting over 50% saving in freight charges. It remains sweet and fresh indefinitely. Can be used from the tin as needed. No waste from spoiling. Mix dry with flour, sugar, etc., in cooking or dissolve in water for use as liquid.

A miner's wife writes: "I have used Klim for everything, with most satisfactory results."

Klim is sold in 1-lb. tins and 10-lb. tins. The larger size is more economical. Ten lbs. makes forty quarts of liquid with the natural milk taste.

CONTENTS, APRIL 1:

Editorial	111
Mineral Production of Ontario, 1917, by T. W. Gibson..	112
Mineral Production of Quebec, 1917, by T. C. Denis....	115
Canadian Placer Deposits, by J. B. Tyrrell.....	116
Magmatic Ore Deposits, Sudbury, Ont., by A. M. Bateman	118
Special Correspondence	122
Markets	126

The discovery of ore in the Violet property of La Rose Consolidated may well prove to be of great importance to the company. Prospecting has been carried on by the company without much success for some time, and it has been discouraging work. Persistency is, apparently, at last to be rewarded. We hope that development will prove the existence of deposits that will give La Rose a new lease of life. As yet, no rich ore is reported to have been discovered on the Violet property; but the chances have been much improved by recent developments.

The preliminary reports for 1917 of Thos. W. Gibson, Deputy Minister of Mines of Ontario, and of Theo. C. Denis, Superintendent of Mines of Quebec, extracts from which are published in this number, show that considerable progress was made during the year 1917, in spite of many handicaps.

The fuel problem has at last attracted almost as much attention as the food problem. Coal producers two years ago attempted to arouse the public to the necessity of recognizing coal as one of the most important munitions of war. Not until recently, however, has the public been willing to believe that the statements made by the operators in the early part of the war were justified.

The peat deposits of Canada have attracted much attention; but so far have contributed very little to our fuel supply. Experimental plants have been installed and the manufacture of peat carried on; but without noteworthy success. There seems to be reason to believe, however, that an economical process of manufacture may be found; and the tests to be carried on by the Dominion and Ontario Governments may have important results.

That classes for prospectors may be of great benefit to the country is indicated by the success of the evening classes at the University of Manitoba. Last fall, one of the members of the class made what may prove to be an important discovery of molybdenite. Recently another prospector brought in specimens which were identified as scheelite, an ore of tungsten.

In this issue, we publish a paper, by Mr. A. M. Bateman, on the origin of the Sudbury nickel-copper deposits. Since Mr. Bateman's paper was written, there has been published another paper dealing with this subject. We will publish in a later issue a summary of the conclusions of H. M. Roberts and R. D. Longyear. These two papers are important contributions to the discussions on the origin of the nickel ore of the Sudbury district.

Mr. James White threatens to have his good friend Mr. Sifton raise the question as to whether the Mining Institute should continue to receive the grant from the Dominion Government. Perhaps the money might be better devoted to the making and showing of moving pictures of Mr. White giving a characteristic speech in defence of the Commission of Conservation.

Development of one of the newer gold districts in Northern Ontario will be hastened by the decision to proceed at once with the exploration of the Otisse property in Powell township. Surface samples from a number of outcrops on this property show high gold values and careful testing is likely to result in a deposit of some size being proven. Information at present is fragmentary. Scattered outcrops of rich ore are known to occur. The structure of the deposits is as yet unknown. We are pleased to learn that this attractive prospect is to be explored without delay.

Mineral Production of Ontario, 1917

By T. W. Gibson.

Deputy Minister of Mines, Ontario.

In the following table, issued subject to revision, is summarized the mineral output of Ontario for 1917. Comparative figures for 1916 are included.

Discoveries of gold continue to be made in various parts of northern Ontario. Last year one of the most promising was in the township of Rickard, some 12

(a) Copper in the matte valued at 18½ cents per pound.
 (b) Nickel in the matte valued at 25 cents per pound.
 (c) Production from Ontario iron ore only.

Gold.

The adverse effects of the war fell with greater force upon the mining of gold than upon any other branch of the industry. The result of scarcity and higher cost of labor as well as of all necessary supplies cannot be transferred, as in other departments of mining, to purchasers of the product, because of the fact that gold has a fixed price. The output was consequently less by 76,935 ounces than in 1916. At the Dome mine, one of the leading Porcupine producers, milling was discontinued in November, and the difficulties of the situation doubtless diminished the output at other properties. Nevertheless, the position of the gold mining industry is essentially sound, and the lessening of production can only be regarded as temporary, pending the return of more normal times. Meanwhile, great progress is being made in the development of ore bodies, and the milling capacity at Porcupine was increased during the year by 1,500 tons daily.

The production according to source was as follows:

Source	Ore Milled tons	Gold Recovered		Gold Extraction per ton \$
		Ounces	Value \$	
Porcupine.....	1,177,928	398,257	8,229,744	6.99

Total.....	1,230,539	420,893	8,698,831	...

miles west of Lake Abitibi, where a Finn named John Raty, staked out a claim on lot 7 in the fourth concession. At 5 feet in depth, the vein shows very coarse gold accompanied by tellurides and other minerals in a milky-white quartz. Another excellent prospect was located by a prospector named Cochenour near the head waters of the Lightning River, a small stream falling into Lake Abitibi from the south. The gold area in Powell and Cairo townships, about 3 miles west of Fox rapids on the Montreal river, has attracted considerable attention. Adjoining the Davidson claims, where the original discovery was made, some stakings made by Sam Otisse contain, it is reported, very wide bands of schist and porphyry, both highly auriferous. In all these areas there is likely to be much activity next season, although the expansion of the gold fields of the Province is to some extent awaiting the return of the prospectors who in large numbers offered their services to their country, and are now somewhere in France.

In addition to the recovery given above, the gold ores yielded 76,223 ounces of silver worth \$61,274, and 2,032 pounds of copper valued at \$552.

The total yield of gold in Ontario to the end of 1917 amounted to \$42,362,479.

The chief producers in 1917 are enumerated in the following table:

Company	Ore milled tons	Gold recovered	
		ounces	value \$
Hollinger Consolidated Gold Mines, Limited.....	514,301	204,810	4,233,777
McIntyre-Porcupine Mines, Limited.....	175,893	81,827	1,696,126
Dome Mines Company, Limited.....	359,570	71,193	1,471,705
Porcupine-Crown Mines, Limited.....	39,111	18,180	375,766
Tough-Oakes Gold Mines, Limited.....	38,695	16,384	338,593
Porcupine V.N.T. Gold Mines, Ltd.....	34,971	10,416	208,350
Schumacher Gold Mines, Limited.....	37,323	9,551	197,413
Teck-Hughes Gold Mines, Limited.....	11,257	3,181	65,753

Silver.

As the table of production shows, the Cobalt mines fell short of the yield of 1916 by about 500,000 ounces, a much smaller falling-off than in the latter year, when the decrease as compared with 1915 was 4,800,000 ounces. On the other hand, the decided increase in the price of silver made the return to the mine owners greater than in 1916 by nearly $3\frac{1}{2}$ million dollars. The increase in the value of silver has naturally been of great advantage, not only to the mining companies at Cobalt, but also to their employees, whose wages automatically advance with the price.

Mining Corporation of Canada now leads in production by virtue of the rich system of veins situated in part beneath the streets and buildings of the town of Cobalt. Nipissing, which maintains its production well, follows, succeeded by Kerr Lake. The mines shipping over one million ounces were Mining Corporation, Nipissing, Kerr Lake, Crown Reserve, O'Brien, Miller Lake-O'Brien and McKinley-Darragh-Savage. The first mentioned shipped 4,546,065 ounces. A new shipper was Adanac, situated southwest of the Temiskaming. Developments at a near neighbor, the Ophir, lying south of the Adanac, are encouraging.

Since the discovery of silver at Cobalt in 1903 shipments from the camp and outlying silver areas have been as follows:—

	Average price, cents per ounce	Ounces	Value \$
1904.....	57.2	206,875	111,887
1905.....	60.4	2,451,356	1,360,503
1906.....	66.8	5,401,766	3,667,551
1907.....	67.5	10,023,311	6,155,391
1908.....	52.9	19,437,875	9,133,378
1909.....	51.5	25,897,825	12,461,576
1910.....	53.5	30,645,181	15,478,047
1911.....	53.3	31,507,791	15,953,847
1912.....	60.8	30,243,859	17,408,935
1913.....	57.8	29,681,975	16,553,981
1914.....	54.8	25,162,841	12,765,461
1915.....	49.69	24,746,534	12,135,816
1916.....	65.661	19,915,090	12,643,175
1917.....	81.417	19,401,893	16,131,013
Total.....		274,724,172	151,960,561

It will be noted from the above figures that the decline in silver production since 1911 has been much less rapid than the rise prior to that date.

The production according to source was as follows:—

	Ounces
Cobalt.....	18,327,258
South Lorrain.....	10,000
Gowganda.....	1,064,635
Silver recovered from gold and copper ores.....	77,914
Total.....	19,479,807

Ontario's Leading Gold Producers in 1917.

Some properties at which operations had ceased came again into production; these include the Trethewey and Cobalt Provincial. The lower diabase contact reached at depth in the Temiskaming and Beaver mines showed some ore, but on the whole was disappointing. In Gow-

ganda the Miller Lake-O'Brien mine produced largely from the high-grade vein opened up in 1916, and this has led to development work being undertaken on nearby locations. A new find of rich silver ore was made by Hugh Miller Kell in the township of Corkill, some 12 miles southeast of the Gowganda deposits. This discovery has not yet been fully developed.

The flotation process for the concentration of dump and low-grade ore is now pretty well established at Cobalt, although there has been some reaction against it. The results so far have been unequal, and the reduction of the concentrates offers difficulties; besides, the position as regards the alleged German ownership of the patents and the excessive royalties with which the mining companies feared they were to be saddled, has not yet been satisfactorily cleared up.

Refineries.—Shipments abroad of ore and concentrates are on the decline. In 1917 United States refineries treated 1,912 tons of ore and 4,396 tons of concentrates, producing therefrom 2,914,267 ounces of silver. The proportion of the silver output refined in the Province was therefore about 80 per cent.

The Deloro, Thorold and Welland refining plants treated 7,964 tons of silver-cobalt-nickel arsenides, recovering 6,450,075 ounces of silver worth \$5,288,739. Year by year a larger proportion of cobalt and nickel oxides are being treated for production of the metals, and also for a variety of cobalt and nickel salts. The figures given for cobalt metal include 81,068 pounds used in the manufacture of stellite, a cobalt-chromium-tungsten alloy used for making high-speed cutting tools. Nickel sulphate and cobalt, both as carbonate and sulphate, are produced by Metals Chemical, Limited. Nickel sulphate is coming into important use for the hydrogenization of oils and fats in the manufacture of soap, oleomargarine, etc. Unseparated cobalt and nickel oxides were marketed in small quantities only. The great use of cobalt as coloring in the ceramic trade, bids fair to be rivalled by its new employment in the metallic form.

Nickel and Copper.

The output of nickel-copper matte in 1917 was 78,897 as compared with 80,010 tons in 1916. The nickel content, 41,887 tons, was greater, but the copper content, 21,997 tons, less than in that year, which may be explained by the fact that the bulk of the Canadian Copper Company's production was from the Creighton mine, the ore of which is well known to contain much more nickel than copper. During the year, 1,453,661 tons of ore were smelted at the Copper Cliff and Coniston smelters. Besides the Creighton mine, the Canadian Copper Company operated the Crean Hill and No. 2, while the Mond Company drew ore from Victoria, Garson, Levaek and Worthington; also silicious copper ore from Bruce Mines. Alexo shipped its output to the Mond Company.

The Royal Ontario Nickel Commission in its report on the nickel industry, issued early last year, estimated the known reserves of nickel ore as 70 million tons, but it is believed that the results of diamond drilling since

the issue of the report have added nearly 100 per cent. to the quality. Explorations at the Levaek, Frood Extension, Murray and Falconbridge deposits have much extended the limits of the ore bodies. The refinery of the International Nickel Company of Canada at Port Colborne is well on the way to completion. It will have a capacity of about 10,000 tons of nickel per annum, and a relative quantity of copper.

Although the nickel-copper mines of Sudbury are the chief source of copper in Ontario, there are other deposits of non-nickeliferous copper ore from which shipments of ore and concentrates were made in 1917 to the extent of 4,173 tons, containing 431,402 pounds of copper, valued at \$89,380. Shippers were H. H. Wood, Mine Centre; Hudson Copper Company, Havilah; Kenyon Copper Mines, Massey; Tip-Top Mine, Kashabowie; Jos. Errington, Gogama station, Can. Nor. Ry.; and Sudbury Copper Company, Iron Bridge. In addition, 110,476 pounds were recovered from silver ore and gold slag treated in United States refineries. On the Hudson Copper Company's property in Galbraith township a handsome showing of copper glance has been uncovered. The average price of copper in 1917 was 27.18 cents (Eng. and Mining Journal) as compared with 27.20 cents in 1916. Since 21st September the price has been as fixed by the United States government, 23½ cents per pound f.o.b. New York.

Iron Ore and Pig Iron.

From three producing mines there were raised and marketed 176,833 tons of iron ore. Of this quantity, 136,343 tons were exported to the United States, the remainder being sent to blast furnaces in the Province. The mines raising ore were Moose Mountain, Magpie and Helen, the first-named belonging to the company of that name, and the last two to Algoma Steel Corporation, Limited. The Helen mine ships to the Magpie, where the ores from the two mines are mixed and treated in the roasting furnaces to produce a Bessemer grade of ore. From Moose Mountain shipments were in the form of concentrates and briquettes.

Blast furnaces at Sault Ste. Marie, Hamilton, Port Colborne and Deseronto smelted 94,318 tons of Ontario ore and 1,221,881 tons of imported ore, the product being 691,233 tons of pig iron valued at \$14,201,695. It may be stated that only 7.15 per cent. of the value of the pig iron output can be credited to domestic ore.

Molybdenum.

Molybdenum ore treated in 1917 at the concentrators of the International Molybdenum Company at Renfrew, Renfrew Molybdenum Mines at Mount St. Patrick, and the Mines Department at Ottawa, totalled 692 tons. From this ore 80,614 pounds of concentrates were produced worth \$108,501. The molybdenum contents of the concentrates varied from 52.9 to 93.5 per cent. of MoS₂.

From the plants of the International Molybdenum Company at Orillia and Tivani Electric Steel Company at Belleville, there was a production of 149,000 pounds of ferro-molybdenum valued at \$348,775.

Molybdenum is one of the metals to which, because of its use for making high-speed tool steel, the war has lent much importance. During 1917 there was an embargo on shipments of molybdenum from Canada to the United States. At the beginning of 1918, this was lifted, and shipments may now be freely made under license permit. Prices ruling in the United States have been much higher than those paid by the Imperial Munitions Board. It is hoped that the better market will stimulate production.

Non-Metallic.

The value of the output of non-metallic products for 1917 was greater than in any preceding year except 1913, when it amounted to \$15,724,376. Of the 24 items in the non-metallic list only five, compared with 1916, show decreased production in quantity, namely, drain tile, hollow building blocks, graphite, lime, sand and gravel. In valuation, decreases are shown by graphite, sand and gravel, sewer pipe and stone. For practically all products prices have advanced materially; this has notably been the case with arsenic, fluorspar and iron pyrites. The Northpines and Gondreau mines of the Nichols Chemical Company each shipped over 100,000 tons of iron pyrites. Fluorspar is in great demand by the steel plants, the entire production being from Madoc. Building was quiet in 1917, hence the output of construction materials was about the same as in 1916.

The yield of crude petroleum exceeded that for 1916 by 214,019 imperial gallons, this being the second year since 1907 that has shown an increase over the one previous. The output from the older parts of the oil region in Lambton county and neighborhood continued slowly to decline; but the falling-off was more than offset by the production from the new field in the township of Mosa, Middlesex county. Oil was struck there in the Corniferous limestone by Mr. J. F. Carman of Petrolia about 1st February. Some 40 producing wells have been drilled, and 13 dry holes. Oil is obtained at a depth of 300 to 375 feet, and the production up to the end of the year was 21,000 barrels. The oil has a gravity of 33 degrees, and is piped or hauled in tank wagons to North Glencoe. The pool so far as defined is on lots 5 to 8 in the fifth, sixth, and seventh concessions.

The output of the natural gas wells was the highest yet recorded. The large well struck in the Trenton, Dover township, has not maintained its original flow, and is now yielding considerable oil. Owing to widespread distress caused by the partial failure of the gas supply during the present winter, the Legislature has placed the entire natural gas industry under the control of the Ontario Railway and Municipal Board.

Miscellaneous.

Four gold mining companies paid out in dividends \$1,699,542.45, and 13 silver mining companies \$5,886,945.94, a total of \$7,586,488.39, being a decrease of \$4,064,061.70 as compared with 1916. There was an increase in the dividends by silver mining companies, but a decided decrease in those by gold companies. The total dividend distributions by silver and gold companies combined up to the end of 1917 was \$82,663,283.

A deposit of euxenite, a rich radium mineral, was found near Maberley in a feldspar quarry in South Sherbrooke township. It does not, however, appear to be present in commercial quantity.

ENEMY GETS CAUCASUS MANGANESE.

By the surrender by Russia of the new area to Turkey, Germany is assured of all the manganese ore she will require during the period of the war and forever afterward, as adjacent to Batum are the largest known deposits of high-grade manganese ore in the world. Germany has been in such straits to obtain manganese that she is now utilizing ore that contains as little as five per cent. manganese, at a prohibitive cost probably. Large quantities are required in war ordnance. Batum and Poti are the export ports of all this ore from the Black Sea. Germany has now secured control of a district that produced about one-third of the world's manganese ore in 1913.

Mineral Production of Quebec, 1917

By Theo. C. Denis.
Superintendent of Mines, Quebec.

The total value of the mineral production of the Province of Quebec during 1917, as shown by the provisional compilation of returns received at the Department of Colonization, Mines and Fisheries, amounted to \$16,051,188. This is an increase of \$2,764,164 as compared with the previous year, or 20.8 per cent.

In the table given below the "building materials" have been kept separate from the "products of the mines." As in the three previous years, the building materials show a decrease, whereas the products of the mine show an increase of 33 per cent.

The mineral production of the province of Quebec for 1917 (Figures for 1917 are subject to revision)

Steady Increase in Value of Output.

The following table gives the total figures of the province for each year since 1900. It may be seen that in eighteen years the value of the mineral production of the province has grown from 2½ million dollars to 16 million dollars, a proportional increase of 540 per cent.

Year	Value	Year	Value
1900.....	\$2,546,076	1909.....	\$5,552,062
1901.....	2,997,731	1910.....	7,323,281

1908.....	5,458,998	1917.....	16,051,188

Asbestos.

Both in value and in tonnage the production of asbestos reached record figures in 1917. The demand was very keen, but, as in the previous year, the shortage of labor was felt. As compared with 1916 the proportional increase in tonnage was 3.0 per cent., and in value 38.9 per cent. The average price per ton rose to \$52.45. In 1916, this was \$38.87; for the previous years the figures were \$31.33 in 1915; \$26.96 in 1914 and \$28.04 in 1913.

The total quantity of asbestos-bearing rock mined and hoisted was 2,634,410 tons. The value of the asbestos extracted from it, counting stocks on hand at the end of the year, was \$8,120,409. This represents a value of \$3.08 of asbestos extracted from each ton of rock. In 1916, 1915 and 1914, these values were \$2.13, \$1.46 and \$1.44 respectively.

Copper and Sulphur Ore.

The shortage of mine labor and transportation difficulties seriously interfered with the production of copper and sulphur ore in the Eastern Townships. The ore is a copper-bearing iron pyrites, which is used for the manufacture of sulphuric acid, the resulting cinders being sent to copper smelters.

In 1917, the quantity of copper-sulphur ore extracted from Quebec mines was 122,822 tons, valued at \$1,205,242. This is a decrease, both in tonnage and value as compared with 1916, and much below what was expected, considering the keen demand for pyrite.

Zinc and Lead Ore.

The production of zinc and lead ores of the Province of Quebec amounted to 4,618 tons, valued at \$242,778.

PRODUCTION OF ASBESTOS IN THE PROVINCE OF QUEBEC FOR 1917.

Shipments and Sales			Stock on hand Dec. 31st, 1917		
Designation of Grade	Tons	Value	Average Value per Ton	Tons	Value
Crude No. 1.....	1,761	\$1,370,740	\$778.38	580	\$470,923
Crude No. 2.....	3,603	1,374,387	381.46	746	269,766
Mill Stock No. 1.....	13,197	1,318,387	99.90	1,089	206,124
Mill Stock No. 2.....	54,072	1,988,197	36.77	3,346	141,344
Mill Stock No. 3.....	64,609	1,146,847	17.75	7,447	124,735
Total.....	137,242	7,198,558	52.45	13,208	1,212,892
Asbestic.....	17,210	42,139	2.45	262	805
Total.....	154,452	7,240,697	13,471	1,213,697

The whole production comes from the mines of Montauban township, in the county of Portneuf, but a great deal of development work was effected on the blende-galena deposits of Gaspé, at the head of the Cascapédia river. It is likely that shipments from these deposits will begin in the course of 1918.

Chromite.

The total production of chromite in 1917 shows record figures. From the Coleraine-Black Lake district, and from the new deposit worked in the Danville district, 35,726 tons were shipped, representing a total value of \$495,981. In 1916, the figures were 27,952 tons valued at \$312,901.

Molybdenite.

The Province of Quebec possesses the largest individual producing mine of molybdenite in the world in the Moss mine, in Onslow township, operated by the Dominion Molybdenite Company. This company has a large concentrator, of a capacity of 150 tons of rock a day, using the Callow process for the separation. During 1917, extensive diamond drilling operations were carried on, which blocked out large reserves of ore.

Magnesite.

The shipments of magnesite, crude, calcined and dead burned, reached 58,090 tons, representing a value of \$728,275. As compared with 1916 this is a proportional increase in value of 38.5 per cent. This increase is to some extent due to the fact that two producing companies are now making dead-burned magnesite. For this purpose, these companies are using the kilns of cement works in Montreal and in Hull, which were not operating on the manufacture of cement during the year.

6,311 Men Employed in Quebec Mines.

During the calendar year 1917, the number of men employed in the mines, quarries and concentrating mills was 6,311 as compared to 6,601 for the preceding year. These figures are on the basis of 300 days work. The work in the mines has been unusually active, notwithstanding the very rainy weather. Although a large number of men new to conditions of the mines have found employment, the total number of accidents has been much less than last year. The number of fatalities is notably less than that of the twelve preceding months, being 4 against 18. The total number of accidents reported to the Bureau of Mines during 1917 was 172.

The proportion of fatalities per 1,000 year men of 300 days work is 0.6. Only accidents resulting in a loss of time of more than 10 days are reported to the Bureau of Mines.

RUSSIAN AND ROUMANIAN OIL FIELDS.

Petroleum men, discussing the benefits to accrue to Germany from possession of the Russian and Roumanian oil fields, agree that despite the difficulties of transportation and the high cost of working the fields, Germany has been placed in a much better position to continue the war. Trustworthy reports indicate that Germany's weakest spot had been in the military transport system, which the reports said was threatened with complete collapse owing to lack of oil for motor trains. With new supplies available, Germany would be quick to replenish stocks whatever the cost. None of the oil men was inclined to minimize the gain to Germany of access to Russia and Roumania.

CANADIAN PLACER DEPOSITS*

In the discussion of a paper by Dr. Mellor on the conglomerates of the Witwatersrand, Mr. J. B. Tyrrell made the following remarks with reference to some of the placer deposits of Western Canada:

I wish to join in thanking Dr. Mellor for his splendid presentation of the characteristics of the conglomerates of the Witwatersrand, with the gold which they contain, and for his most interesting discussion of the methods which Nature may have adopted in forming these beds of conglomerates, and in placing gold in them.

The occurrence of a conformable sedimentary series five miles in thickness, like that of the Witwatersrand, is not in itself a matter for very particular comment, for such series occur in other parts of the world, especially along the flanks of important mountain ranges, and the coarseness or fineness of the sediments in them depends largely on the strength of the currents, whether caused by winds, tides, or rivers, by which the sediments were distributed. If small particles of gold, as well as pebbles of quartzite or other similar rock, were being supplied to the moving waters at the same time, they would be distributed together, but large particles or nuggets of gold would not be carried by water and dropped along with small or medium-sized pebbles of quartzite, etc., for the currents that would easily carry the latter would not move the former.

Gold in Edmonton Sandstones.

In Western Alberta, in a great series of conformable Mesozoic and Tertiary sediments, gold occurs in a finely divided state in the Edmonton sandstones at top of the Cretaceous. These beds were laid down near an old shore line, and the fossils contained in them prove that they were deposited in brackish water. No beds holding a sufficient quantity of gold to pay for mining have yet been discovered in these sandstones, but the streams which now drain the country east of the Rocky Mountains cut down into them in many places, and concentrate the gold derived from their sandstone banks into the gravel bars in the rivers, whence it is collected by simple methods of alluvial washing. The gold so obtained is in very minute particles which, under the microscope, may be seen to be well rounded like most other particles of placer gold. I believe that it is also in the form of such minute rounded particles in the Edmonton sandstones, from which it is derived, for no matter how near the gravel bars which now contain it may be to its probable source in the sandstone itself, the gold always presents the same rounded appearance.

Whether the gold is confined to certain definite strata in the series or not I do not know, but I have definitely determined its presence in, or in the immediate vicinity of, some of the beds of lignite which are interstratified with the sandstone.

In this particular instance the source of the gold is reasonably certain, for it was undoubtedly transported from the granite mountain range away to the west within the confines of the province of British Columbia, and was carried 200 miles or more before it finally settled near the shore of the brackish sea. Though nowhere concentrated into rich pockets or beds the total quantity so carried from the mountains must have been large.

In a disseminated placer, in which the gold has been distributed by tidal currents over a sea floor, no "pay-streak" such as is commonly found in stream placers.

would be looked for; but if actual beaches should be discovered, paystreaks might reasonably be expected to occur, for the gold would have been concentrated in them by the waves. In this connection the distribution of the conglomerates in the Far East Rand, described by Dr. Mellor in his paper, and illustrated by him in Fig. 48, strongly suggests the presence of such beaches formed on a gently sloping shore which was at the same time slowly and regularly sinking beneath the sea. Such a method of formation would account perfectly for the local parallelism of these bands of conglomerate.

Stream Placers of the Klondike District.

Stream and ocean placers have some common characteristics, and it may be interesting to refer to one or two of these. In the Klondike District, where I was mining placers for a number of years, the gold-bearing gravels occur in the bottoms, or what were once the bottoms, of river valleys. They are essentially of two ages, namely, Older Pliocene gravels and Newer Recent gravels. The former occur in the bottoms of wide, mature valleys, with gently sloping sides on which the underlying rock has decayed to such an extent that naked cliffs and escarpments are unknown; while the latter are in the bottoms of narrow, immature, and often gorge-like valleys cut in the bottoms of the old Pliocene valleys. These newer valleys are thus cut down through the older gravels, sometimes one or two hundred feet into the underlying hard granitoid gneiss or schist, and what remains of the older gravels may lie along the top of the steep banks of the newer valleys. In both these gravel deposits, wherever gold is present, it is concentrated in a thin, but ill-defined, layer just above bedrock and in the fissures of the underlying bedrock. The total average thickness of the gold-bearing layer might be put at 3 ft., 1 ft. of this being gravel and 2 ft. bedrock, though this thickness varies greatly in different places. In some parts of Dominion Creek the "pay," though very rich, was confined to a few inches of gravel just above bedrock, and the underlying bedrock was barren; while on a mining claim on Hunker Creek, which yielded a large quantity of gold, there was scarcely any gold in the gravel or in the upper foot of bedrock, for it had sunk as much as 7 or 8 ft. into the cracks of this bedrock.

The Newer Recent Gravel.

In the Newer Recent gravel the gold-bearing layer lies below the water level of the stream in the valley of which it occurs, and associated with the gold there is usually an abundance of "black sand," composed chiefly of small grains of magnetite and ilmenite, with some hematite and a little impure cassiterite or tin-stone, all more or less thoroughly rounded. This black sand lies loose in the gravel or in the cracks of the bedrock, being distributed much in the same way as the gold. On some mining claims crystals of pyrites were collected in considerable quantity with the gold in the sluice boxes. The crystals were always beautifully sharp and angular; I do not remember to have seen any that were rounded or waterworn. On closer investigation these crystals were invariably found to have been broken out of the underlying bedrock, and not to have been derived from the gravel. One claim which I was operating on Hunker Creek yielded large quantities of these crystals from a bedrock of dark graphitic schist.

The gold itself, both in the gravel and in bedrock, was always in more or less rounded and waterworn

nuggets and particles, known collectively as "dust." Even where originally in elongated or thread-like forms, these particles had been pounded and bruised, so that their points and angles had been rounded off. No new crystals or crystalline films of gold had been formed anywhere since this Recent gravel had assumed its present position.

With regard to the older Pliocene gravels, wherever they were well situated for examination, as on the tops of the banks of the newer valleys, they were found to contain neither magnetite nor pyrites. If either of these minerals had ever been present they had been leached out.

Recrystallization of Gold in the Older Pliocene Gravels.

In these older gravels most of the contained gold was in the form of well-rounded particles similar to those in the newer gravels. But in addition to such rounded particles or grains there were many pieces which showed beautiful sharp crystalline structure, either in moderately stout forms, or in delicate feathery shapes such as it would be difficult or almost impossible to move without crushing or destroying. In many cases this gold was in the form of thin crystalline films, between layers of the schistose bedrock, while, in one instance, Mr. McConnell, now Deputy Minister of Mines of Canada, drew my attention to a very delicate film of gold adhering to the outside of a pebble in the gravel.

Such crystals had never been mechanically transported along with sand and gravel by water, but had evidently been formed just where they were found. The gold would seem to have been first dissolved, probably by the action of water on the surrounding "dust," and then to have been precipitated from the solution, but in no instance did I find any evidence that pyrites took any part in this action, or was precipitated with the gold. Possibly the gold had not been carried any appreciable distance in solution, for the beautiful, fragile crystals above referred to were always found within the narrow limits of the original thin gold-bearing layer of gravel and bedrock, and not in the gravel above it or in the bedrock below it.

If the process of solution and precipitation which gave rise to these crystals were carried far enough it is quite conceivable that it might completely destroy the rounded character of the particles of gold usually found in placer deposits, and give rise to forms and characteristics similar to those found in the conglomerates of the Witwatersrand.

In the final summing up of the discussion, Dr. Mellor made these comments on Mr. Tyrrell's remarks:

"It is interesting to see that Mr. Tyrrell, whose experience with placer deposits is so extensive, finds no difficulty in accepting the gold of the Edmonton sandstones as alluvial, although it is so finely divided and so far from its source; and he also thinks it reasonable that large particles or nuggets of gold should hardly be expected in a deposit of medium-sized pebbles. Both these features in the Rand conglomerates appear to have given difficulty to those who limit their comparison to river gravels and similar alluvial deposits.

"Mr. Tyrrell's example of the solution and recrystallization of gold in Pliocene gravels is particularly interesting, especially as recrystallization seems to have taken place without any extraordinary conditions of temperature or pressure on the action of any particular solvent, such as are frequently demanded by those who find difficulty in accepting the recrystallization of the Rand gold."

Magmatic Ore Deposits, Sudbury, Ontario

By Alan M. Bateman.

The following is an abstract of a more extended paper published in *Econ. Geol.* Vol. 12, p. 391, 1917. Some articles relating to the Sudbury deposits have appeared since this paper originally went to press, and unfortunately are not included in it. They are: "Geology of the Sudbury Area," Royal Ont. Nickel Commission, 1917; "Magmas and Sulphide Ores," by Coleman, A.P., *Econ. Geol.*, Vol. 12, p. 427, 1917; "Quantitative Measurements of Minerals of the Nickel Eruptive at Sudbury," by Dresser, M.A., *Econ. Geol.*, Vol. 12, p. 563, 1917.

No other types of deposit have perhaps excited more scientific interest than those for which a syngenetic magmatic origin has been claimed. This is especially true for deposits of sulphides supposed to be of magmatic origin. Geologists have had little difficulty in accepting a magmatic origin for deposits in which the ore minerals are also common rock-forming minerals, such as magnetite deposits. On the other hand, there has been hesitancy in accepting a like origin for deposits in which the ore minerals are not common accessory minerals of rocks, such as sulphides. For this reason the Sudbury deposits have attracted more than usual interest—an interest increased by the fact that these ore bodies constitute the greatest nickel deposits in the world and because both a magmatic and hydrothermal origin have been claimed for them.

In his investigation of the literature of the subject the writer encountered certain conclusions supported by convincing evidence, and also opposing conclusions supported by equally convincing evidence, suggesting that a more correct conclusion would be one which includes some of the evidence presented by each side. Such a conclusion has been presented by one investigator.* A modification of this conclusion is presented by the writer, and it is believed that it is supported by convincing evidence on both sides and meets some of the objections advanced by different investigators.

Field Relations.

Rock Formations—The Sudbury nickel-copper deposits are intimately associated with a norite-micropegmatite intrusion, called by Coleman† the "Nickel Eruptive." It is in the form of a great spoon 36 miles in length and 15 miles in width. The centre of the spoon is filled by 9,000 ft. of sediments of Upper Huronian Age and rests upon a great thickness of crystalline and sedimentary pre-Cambrian rocks. All supposedly older than the nickel eruptive. Knight‡ has recently shown that a part of the granite footwall of the norite on the south side of the spoon is not older than the norite but intrusive into it. The latest phase of igneous activity is represented by numerous large diabase dikes which cut the norite and ore and are themselves cut by small granite dikes.¶

Ore Deposits—The Sudbury district is the source of the world's greatest nickel supply and is also an important producer of copper. Platinum and small amounts of silver, gold, and palladium are won from the ores, and iridium and osmium have also been noted. The present ore reserves indicate a supply for many years to come, and development and exploratory work are continually exposing more orebodies. Geologic conditions indicate that future work will add greatly to the present reserves so that a long life may be expected for the district.

Coleman* distinguishes two main varieties of ore-

*Ernest Howe, "Petrographical Notes on the Sudbury District," *Econ. Geol.*, Vol. XI, p. 503, 1914.

†Coleman, A. P., The Sudbury Laccolithic Sheet, *Jour. Geol.*, Vol. 15, p. 252, 1907.

‡Knight, Origin of the Sudbury Nickel Deposits, *Eng. & Min. Jr.*, Vol. 101, p. 811, 1916.

§Coleman, A. P., The Nickel Industry, Can. Dept. of Mines, Mines Branch No. 179, p. 11, 1913.

bodies, "marginal" and "offset" which he summarizes as follows:

Marginal (a) dipping toward the axis of the basin, ores with comparatively little rock and more than twice as much nickel as copper. (b) Faulted marginal—irregular in shape and character—usually mixed with much rock and carrying as much copper as nickel, or sometimes more.

Offsets: (a) Columnar offsets, roughly cylindrical bodies nearly vertical and going to great depth. Ore usually rich in copper and the precious metals. (b) Parallel offsets—not columnar, but sheet-like, dipping inward toward the basic edge. Ore like that of the usual marginal deposits.

Of these, the marginal deposits are the most important. They occur at the basic margin of the norite so that the norite forms the hanging wall and the adjoining country rock the footwall. Coleman states that orebodies may have a distinct foot-wall or may penetrate it along fissures and enclose blocks of it. He considers the hanging wall to merge gradually into a blending of rock and ore called pyrrhotite-norite, and then into pure norite with blebs of ore. Howe's‡ description of the Creighton differs from that of Coleman in that he considers the change from ore to norite to be less gradual and the "graduation to be due to a mechanical mixture of sulphides and norite in the transition zone, and not to a graduation in a mineralogical sense."

The offset deposits§ are like masses of ore and rock that extend outward from the main norite mass into the underlying older rocks, or more or less separate bodies having no visible connection with the main norite body. The columnar offsets as at Copper Cliff and Victoria mines are pipe-like bodies, somewhat resembling the Kimberley diamond pipes, from 50 ft. to 200 ft. in diameter.

Of the minerals that compose the Sudbury ores pyrrhotite, chalcopyrite, and pentlandite are the most important. Of these pyrrhotite is abundant, chalcopyrite is common, and pentlandite is common but is rarely seen with the naked eye. Less commonly pyrite, galena, and zincblende occur associated with quartz and carbonate and are usually in veins which, according to Coleman|| are later than the main ore bodies.

Previous Views of the Origin of the Sudbury Ores.

The scientific interest attached to the celebrated Sudbury deposits is due not only to their unique character but to the problem of origin they present. The previous investigators may be divided broadly into two schools; those favoring an origin by means of hydrothermal agencies, and those by magmatic differentiation. Some modifications of both hypotheses have been advanced.

The earlier views have been so excellently summarized by A. E. Barlow|| that it is necessary only to refer to them without further discussion. Barlow states that the first investigators, Collins, Merritt, and Bell, ascribed a hydrothermal origin to these deposits; the same origin was adopted later by Emmons, Bush, Argall, and others.

The first to advocate an igneous origin for the Sudbury deposits was Barlow. Somewhat later Vogt advanced a similar origin to explain the Norwegian deposits. Since that time Barlow's views have been advocated by Adams, Browne, Kemp, Walker, and

*Coleman, A. P., The Nickel Industry, Mines Branch, No. 170, 1913, from which the descriptions here given are drawn.

†Idem, p. 34.

‡Howe, Ernest, *Econ. Geol.*, Vol. 9, p. 514, 1914.

§Op. cit. 35.

||Op. cit., p. 27.

others. In later years Coleman has carried on extensive work in the Sudbury district and is perhaps the strongest advocate of the views of Barlow. After Barlow's explanation appeared there was no dissenting opinion until C. W. Dickson* concluded that the sulphides were deposited from solution. A similar study led Beck† to the same conclusion. Later Campbell and Knight‡ investigated the problem by a metallographic study and supported Dickson's views.

In 1911 Ernest Howe and J. D. Irving visited the Sudbury region and Howe§ advocated a modified igneous origin for the Sudbury deposits by which differentiation took place in the magmatic reservoir and the sulphides were intruded as such, in a molten state. In 1916 a preliminary article appeared by C. W. Knight|| in which he shows that the age relations of some of the intrusive rocks are different from what had hitherto been considered, and he concludes the ores are of hydrothermal origin. The latest publication dealing with the Sudbury deposits is that by Tolman and Rogers|| in which the ores are believed to have been formed by replacement of the norite by the action of "mineralizers."

Discussion of Recent Views.

Magmatic Segregation—Coleman's summary of the arguments in favor of magmatic segregation are:**

1. Universal association of ore and norite of a single eruptive sheet.
2. Intimate admixture of ore and norite and gradation from norite with scattered particles of ore, to pyrrhotite-norite with equal amounts of each, to almost pure ore with few rock minerals.
3. The adjoining footwall rocks are not spotted by ore nor do they surround separated bodies of ore; they are penetrated by veinlets of ore and included as blocks within the ore. This feature is due to shattering at the time of the norite intrusion and the heavier and probably more fluid sulphides filled all the spaces thus opened. Clean walls of country rock abut against large bodies of pure ore.
4. The freshest norite is generally close to orebodies and often spotted with ore. No considerable rearrangement caused by water could have taken place without altering so susceptible a mineral as hypersthene.
5. Absence of hydrothermal or pneumatolitic action in marginal orebodies; no banded cavity fillings or concentric structures typical of hydrothermal deposition. Scarcity of usual hydrothermal minerals.
6. Uniformity of deposits, regardless of the nature of the foot-wall rocks, throughout the entire norite margin indicates a single source, the norite.
7. Largest orebodies occur where bays of norite project into the country rock or on offsets from such funnel like bays; paucity of deposits along a straight margin. This is intelligible if the ore settles into the hollows underneath the molten sheet, but not so if formed from solutions.

Coleman's first argument of invariable association of ore and norite favors magmatic segregation. This same association holds true throughout the world, and there is no conclusive evidence against sulphides forming a part of an igneous rock and passing through a

molten condition. Magmatic sulphides have been noted in many rocks from many localities.

Coleman's second argument is one of the strongest advanced by the advocates of a magmatic segregation, and if true is one of the strongest points in favor of magmatic segregation as opposed to a hydrothermal origin. Howe*, however, has shown that in the Creighton mine this is a mechanical fading out and not a petrographic one as contended by Coleman. Specimens examined by the writer support a part of Coleman's contentions and indicate that while the main bodies fade out mechanically, beyond them there is a pyrrhotite norite in which the pyrrhotite gives every appearance of being an original constituent. Knight† states that the footwall rocks are also spotted with sulphides in a manner similar to the pyrrhotite norite. The statements by Howe and Knight invalidate to considerable extent the strength of the argument of fading out as a proof of magmatic segregation, and investigation indicates that while most of the transition is a mechanical one, there is also a small amount of petrographic transition.

The first part of Coleman's third argument is directly contradicted by Knight‡ who states that granite, greenstone, and graywacke are also spotted by ore, and that some of the orebodies are actually impregnations of the footwall rocks. A latter part of Coleman's third argument is given as an explanation for the ore in veinlets in the footwall rocks but is opposed to magmatic segregation for such spaces, which he states were formed by the intrusion, would have been filled by undifferentiated magma, and probably chilled, long before differentiation would have proceeded far enough to allow of any segregation of molten sulphides at the bottom of the norite. There is no evidence of any undifferentiated magma at Sudbury.

Coleman§ similarly explains the offset deposits, but the same objections apply.

Coleman's fourth argument pertaining to the freshness of the hypersthene in the norite is strongly opposed to a hydrothermal origin for these deposits, and while suggestive of a magmatic segregation, it cannot be used exclusively for it. Many investigators have found that there is considerable alteration of the norite and that in the large orebodies it is greater adjacent to the ore. Many pages have been written minutely describing the nature of such alteration.

In the fifth argument, the scarcity of typically hydrothermal ore-forming minerals is a further indication that these deposits are not to be classed as entirely of hydrothermal origin, but neither is it proof of magmatic segregation. Also the lack of banding, concentric and preserved structures suggests an origin other than hydrothermal but can no more be used as an argument in favor of magmatic segregation, as is done by Coleman and others, than of contact metamorphic deposits.

Coleman's sixth argument is suggestive of an igneous origin. It is opposed to a hydrothermal origin, for it is difficult to understand how ores deposited from solutions with fluctuating conditions of composition, concentration, temperature, and pressure could be so uniform all around the norite intrusive. It is, however,

||These points are discussed more fully in the original paper, pp. 408-410.

no stronger an argument for Coleman's magmatic theory.

Coleman's contention, in the seventh argument, that the settling of the molten sulphides into the hollows of the footwall under the molten sheet can be explained only by an hypothesis of magmatic segregation, is decidedly upset by Knight's evidence.* He states "Clearly then the molten sulphides could not have settled to the bottom of the norite magma for the very good reason that the granite was not there when the norite was erupted."

Probably the strongest argument in favor of a magmatic segregation is the marginal position of the ore-bodies with respect to the intrusive. It is difficult to explain this position by any other hypothesis.

The breccia of footwall rocks enclosed in ore and norite is construed by Coleman in favor of a magmatic segregation.† He considers it to have been formed by the molten sulphides and norite on the bottom of the intrusion tearing off and enclosing fragments of the footwall on its way to its present position.‡ This would assume the sulphides to have been already segregated on the bottom of the norite while the intrusion was reaching its present position, a condition impossible in view of the length of time that must elapse before differentiation could proceed far enough for sulphides to accumulate at the bottom. The breccia, in the view of the writer, is opposed to magmatic segregation, but is readily and simply explained by Howe's hypothesis.

While certain evidence suggests that a minor amount of magmatic segregation took place, it would appear that a great array of conclusions is opposed to it as an adequate explanation of the Sudbury ores. Some other hypothesis must then be sought.

Hydrothermal Origin.

Dickson§ found several features irreconcilable with a magmatic origin. He found evidence of solutions in (1) the replacement of rock forming minerals by sulphides, (2) by development of secondary hornblende, greater where ore replacement had been greater, (3) widespread brecciation and shearing with ore filling the shear planes and acting as a cement to the rock fragments, (4) angular shape of included rock fragments, and (5) abrupt changes from massive sulphides to barren rock. Dickson produces many arguments which oppose magmatic segregation but do not necessarily uphold the hydrothermal origin. In fact many of them support Howe's modified magmatic hypothesis equally well. He also produces evidence which indicates that hydrothermal solutions have been a factor in the formation of the ores.

Campbell and Knight|| think that the sulphides have replaced each other, traversed rock and silicates occur in definite order, thereby indicating hydrothermal origin.

Knight shows (1) that the sulphides could not have segregated upon the granite footwall for it was not there (2) that they mix with the older greenstone and graywacke and younger granite as they do with the norite. (3) The occurrence of hydrothermal minerals in the Worthington mine is emphasized. Since ore penetrates the granite and Knight shows that the granite cuts the norite, it is clear that the ore is both later than the granite and norite, and cannot, therefore, be a segregation from the norite.

*Loc. Cit., p. 811.

†Op. Cit., pp. 34-36.

‡Op. Cit., pp. 34, 36.

§Op. Cit.

||Microstructure of Nickeliferous Pyrrhotite, Econ. Geol., Vol.

The writer agrees with Knight in so far as he shows magmatic segregation to be untenable, but fails to find in his arguments positive evidence actually supporting a hydrothermal origin for all of the deposits. Because his structural relations deal a fatal blow to magmatic segregation, it does not necessarily follow that because a rival view is vanquished, the conclusion of a hydrothermal origin is the only alternative, for it supports Howe's modified theory as well.

The writer thinks that the advocates of a hydrothermal origin produce certain evidence to show that it has played some part in the ore formation, but that it does not conclusively prove that all of the deposits have been formed by this means. While a certain amount of hydrothermal rock alteration is present, the profound hydrothermal alteration found in most deposits of unquestioned hydrothermal origin, is absent from the Sudbury deposits, otherwise the norite would not be dark, but light in color.

Modified Magmatic Origin.

Howe* found that the intimate mixture of granite, greenstone and norite in the ore precludes a hydrothermal origin and that microscopic work indicates that the sulphides were introduced in a molten state. He proposed his modified magmatic hypothesis, which accounts for the ore as having been introduced in a molten condition through a differentiation in the magmatic reservoir, after the norite had cooled. Thus the deposits would be magmatic, though no segregations.

Knight's later finding, that at the Creighton mine the granite intrudes the norite, does not invalidate the principle of Howe's hypothesis, for his supposed intrusion of sulphides can just as well be regarded as having taken place after the granite intrusion.

As Howe's paper deals chiefly with petrographical notes he offers little discussion in support of his hypothesis; consequently there is no explanation as to how his hypothesis reconciles the marginal position of the orebodies. This theory, in the belief of the writer, accounts for the Sudbury conditions more accurately than any previously advanced.

Modified Hydrothermal Origin.

Tolman and Rogers† believe that the ores are magmatic, yet formed by means of "mineralizing solutions" or mineralizers. They state that the sulphides surround, cut across, and replace rock silicates, and they present microscopic evidence which they interpret to indicate that the sulphides were formed before the hydrothermal alteration of the rock silicates. They would thus place the period of mineralization after the consolidation of the norite, and before the hydrothermal solutions, which emanated as an after effect of the intrusion. They consider that the ores are not magmatic in the usual sense, because they are later than and replace the rock silicates, and that they were deposited by "mineralizing solutions"; but they do not consider them to be ordinary hydrothermal deposits because the formation of the sulphides is thought to precede the hydrothermal alteration of the rock silicates. They re-define "magmatic ores" to fit in with their interpretation, and assume a definition for hydrothermal not usually accredited, i.e., the ores must be accompanied by alteration of the rock minerals. In view of findings of other authors and the writer, the abundant evidence of replacement noted by Tolman and Rogers cannot be typical of all the Sudbury ores. Their age relation between the formation of the sulphides and the alter-

*Op. Cit.

†Tolman, C. F. and Rogers, A. F. Magmatic Sulphide Ore.

ation of the rock silicates upon which they base their new type is also seriously open to question.*

In view of the evidence shown by others it is incorrect to apply broadly the theory of replacement to explain all of the Sudbury ores. The writer is unable to see in what way the arguments of Tolman and Rogers present any but a hydrothermal origin for the Sudbury ores.

One point seems clear, and that is that the ores could not all have been formed by magmatic segregation, and that they were introduced later than the norite. The problem of origin, then, concerns itself chiefly with the agencies of transportation by which the ores were brought to their present place, whether hydrothermal or igneous intrusion of sulphides.

Suggest Modified Hypothesis for Origin of Sudbury Ores.

The above discussion indicates that the genesis of the Sudbury ores is complex and that there is much conflict of opinion both as to interpretation of data and observations. The opposing hypotheses set forth an array of arguments and facts that is persuasive when one hypothesis alone is considered. All of them present plausible and convincing points which are not explained or set aside by the opposing arguments and are worthy to stand in any consideration of origin of the Sudbury deposits.

It thus appears to the writer that an hypothesis which would embrace the convincing arguments of the opposing views, if in agreement with other observations, would be a correct one. Accordingly he presents a modified hypothesis, which follows Howe's and embraces and comprises some of the features of the others:

In a magmatic reservoir beneath the Sudbury region differentiation took place, but before completion a portion of it was extruded to form the "Nickel Eruptive." The extruded portion continued to differentiate in the upper chamber and gave rise to the micropegmatite-norite transition. The sulphides present became segregated to the bottom of the norite thereby accounting for the pyrrhotite norite and perhaps a minor part of the orebodies. In the meantime differentiation continued in the remainder of the magma below, and it may be considered to have divided itself into an acid and basic portion. A further intrusion then injected the acid portion between the already solidified norite and the greenstones, forming the granite described by Knight. Following this, the process as conceived by Howe may be considered to have taken place and an expulsion took place of a magma overloaded by sulphides, which, upon consolidation, formed the greater part of the orebodies. Still later expulsion gave rise to the dikes which cut the ore and previously intruded rocks. As an after effect of the igneous activity, magmatic waters, similar to those which emanate from most ore deposits, traversed the previously formed deposits, super-imposing upon them those hydrothermal effects described by Dickson, Knight, Tolman and Rogers, and others. The solutions then wandering farther from the norite contact formed those outlying deposits, such as the Worthington, whose hydrothermal characteristics are unquestioned. Thus there was completed a sequence of igneous activity of which the formation of the ore deposits was a part.

This modified hypothesis would explain the ores by magmatic segregation, magmatic differentiation in the magmatic reservoir, and hydrothermal action, but the

greater part of the larger orebodies would be accounted for by differentiation in the reservoir and intrusion as a heavily charged sulphide magma.

Relation of Proposed Hypothesis To Other Hypotheses.

The proposed hypothesis would account for the pyrrhotite norite and for the sulphide particles so widely distributed along the margin of the norite by the first phase of the mineralization. The main marginal deposits, as the Creighton, and the offset deposits, would be accounted for chiefly by the second phase of mineralization, or the intrusion of sulphides and some rock matter. Thus the objection raised by Coleman that* Howe's hypothesis does not explain the pyrrhotite norite, is met by the first phase of mineralization, while the second phase would account for the ore breccia with fragments of rock surrounded and penetrated by sulphides. This breccia cannot adequately be explained by the segregation hypothesis since the granite is later than the norite and the ore is later than the granite. The filling of all cracks and like openings by ore, so difficult to account for by segregation, is readily explained by the hypothesis proposed.

The observations of Dickson† are explained by Howe's part of the hypothesis, but not by the segregation theory. Dickson uses his points to uphold the hydrothermal theory, but the angularity of the fragments suggests inclusion by intrusion rather than nuclei of unreplaced rock. The abundant evidence presented by Dickson and others of sulphide veinlets seaming rock fragments and penetrating mineral cleavages would be expected from sulphide intrusion as well as from hydrothermal action, so that the proposed hypothesis combines those features advocated for the hydrothermal origin and antagonistic to the segregation theory.

The comparative freshness of the norite surrounding the ore is readily understood if the ore be an intrusion, but not if all the ore were formed by hydrothermal agencies, for, as Coleman points out, the susceptible hypersthene would surely succumb to alteration. While some hydrothermal alteration is present, notably in the offset deposits, it is nothing as compared to the extensive alteration accompanying ores of unquestionable hydrothermal origin. Another point that suggests igneous origin is the absence of the gangue minerals that usually accompany hydrothermal ores. With an igneous origin the only gangue to be expected is the accompanying rock, such as is found in the ores. The order of succession of sulphides is advanced in support of deposition from solutions, but the mineral succession in a granite does not imply solutions. Howe suggests that the order would seem to be better explained by the nearly simultaneous cooling of the different sulphides that had previously separated as distinct mineral compounds, non-miscible, though still molten." In this way the last to crystallize would penetrate the earlier sulphides.

Certain features, such as the alteration of the pyroxene and the occurrence of typically aqueous minerals are clearly indicative of hydrothermal origin and are to be attributed to the hydrothermal phase of mineralization in the proposed hypothesis. The writer believes that only a minor part of the orebodies has been contributed by solutions and that their work had been chiefly a slight alteration and contribution of ore with a certain amount of enrichment and rearrangement of some of the previously formed sulphides. It may be seen that hydrothermal mineralization of this nature

*See also more recent paper by M. A. Dresser, *Econ. Geol.*, Vol. 12, p. 562, 1917.

†*Econ. Geol.*, Vol. 10, p. 390, 1915.
†*Op. Cit.* p. 59.

super-imposed upon previously formed ores would confuse characteristics of the previous processes, and a study of those places most affected would give rise to the impression that all of the ores had been formed by hydrothermal agencies. The hydrothermal origin of the Sudbury ores has attained in the literature a position hardly justified, because observations antagonistic to the segregation theory have been applied as convincing arguments in support of a single working hypothesis when they are capable of more than one interpretation if applied to multiple working hypotheses.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

The policy of the Provincial Government in increasing taxation of the mineral industry is meeting with protest from some of its own friends as well as from most mining men. Recently the Victoria Daily Times, which is the leading newspaper supporter of the Government, printed an account of a debate in the Legislative Assembly in the course of which it reported a prominent supporter of the Government to have stated that "the mineral world is smarting under an injustice in the matter of its taxation. He quoted much statistical data, and pleaded the case of the concern mining low-grade ore. One operator would spend \$1,000,000 to take out \$1,250,000, while his neighbor would spend but \$500,000 with a similar result, and yet both were subjected to the same taxation method. The point he was anxious to drive in was that the mining world should be taxed on an entirely fresh basis. He would advocate a policy that would say to the capitalist who wished to mine in British Columbia, 'Come in and develop the minerals, and just so soon as you show that you are mining at a profit that will be the stage at which British Columbia will step in and ask you to pay a just due on account of that profit.'"

The Daily Colonist, the oldest morning newspaper published in British Columbia, has displeased some of those who have in recent months been busily engaged in advocating the establishment of an iron and steel industry in British Columbia. In the course of some timely editorial comment the Colonist observed: "When British Columbia's delegates go to Ottawa to place before the Government this Province's claim to assistance in establishing an iron and steel industry on the coast, probably they will be subjected to a series of questions which we hope they will be in a position to answer in a way which will be satisfactory to the Federal power. They will have to be able to say what capital is already available for the establishment of such a plant. Very naturally they will be asked about labor conditions in this Province, the wages that prevail, the supply of skilled workers for such an industry, and the permanence of the economic situation. A subject of conversation with the Government will also be the extent to which the Provincial authorities are prepared to aid the enterprise." This frank expression of opinion is not pleasing to some prominent members of the Victoria Rotary Club, which has taken the lead in the agitation of the last few months with the object of trying to induce the Federal Government to practically establish the desired industry, consequently the Colonist has come in for sharp criticism.

EAST KOOTENAY.

There has been a substantial increase in the quan-

tity of ore shipped to the smelting works at Trail from East Kootenay mines since the beginning of the current year. The total of ore receipts at Trail from this district for the month of January was 5,843 tons; for February it was 8,069 tons, and for the first week of March 2,289 tons, together 16,201 tons to March 7, inclusive. Of this total, 14,897 tons was from the Consolidated Mining and Smelting Co.'s Sullivan mine—14,765 tons of zinc ore and 132 tons of lead ore. While the same company's St. Eugene mine sent in 162 tons of lead ore. The Paradise mine, in Windermere mining division, shipped 1,078 tons of silver-lead ore, and three small mines the remaining 64 tons.

WEST KOOTENAY.

Ainsworth.—While the largest shipper from Ainsworth mining division so far this year has been the Consolidated Co.'s No. 1 mine, with an output of 1,337 tons of silver ore, several other mines have resumed production, among them the Bluebell with an output of 203 tons of lead ore, and the Florence which late in February shipped 209 tons from its concentrating mill. Of half a dozen other shippers, the largest individual total was that of the Montezuma, on South Fork of Kaslo Creek, which shipped 106 tons from an old dump, the mine not having been worked in recent years.

Slocan.—Slowly shipment of ore from Slocan mines to Trail is being resumed. Total of 1918 receipts to March 7 was 2,501 tons, of which 1,242 tons was from the Surprise, in the neighborhood of Sandon, and 889 tons of zinc ore from the Lucky Jim, in the eastern part of the division. Half a dozen or more of the smaller producers are also on the shipping list. The Standard has shipped zinc concentrate to the United States and has stored its lead product. The Galena Farm is preparing to make a considerable output this season. The several mines being worked by the Clarence Cunningham syndicate are in a position to produce silver-lead ore in quantity whenever conditions shall be less disadvantageous than of late. Development work is being continued on other properties, preparatory to production later.

Nelson.—The Emerald mine, near Salmo, in the southern part of Nelson division, has shipped to Trail about 200 tons of lead ore, and two or three small lots of ore from other properties in that part of the district have also been received there. The Consolidated Co.'s Molly Gibson mine, at the head of Kokanee creek, and the Beasley-Monarch, also on the north side of the Kootenay river, have both shipped ore this year. The total output of ore from mines in this division, though, is disappointingly small.

Rossland.—Rossland mines are maintaining a comparatively large output, their total to March 7 of ore received at Trail having been 40,266 tons, of which the Le Roi shipped 18,656 tons, the Centre Star group 17,866 tons, the Le Roi No. 2 Ltd.'s Josie group 2,803 tons, and the White Bear 941 tons.

Trail.—Ore receipts at the Consolidated Mining and Smelting Co.'s smeltery here during the week ended March 7 totalled 8,958 tons, this quantity bringing the total receipts for the year to that date up to 70,351 tons, of which 61,047 tons was ore from mines operated by the company and 9,304 tons was of custom ores.

BOUNDARY.

Little news of operations at the Boundary district mines and smelting works of the Canadian Copper Corporation and Granby Consolidated M. S. & P. Co., re-

spectively, is being made public; so that there is nothing to chronicle other than that both companies are continuing to work their mines and that ore-smelting is being continued at their smelting works.

The Consolidated Co. is maintaining a fairly large output of copper-gold ore from its Emma mine, situated in Summit camp, two miles from Eholt. This year's receipts at Trail to March 7 show a total of 6,697 tons.

Vancouver men have taken the Union mine, in Franklin camp, north of Grand Forks, under bond and option of purchase. Transportation conditions are at present unfavorable to any considerable output of ore being made from mining properties in that camp.

GENERAL NOTES.

A Vancouver mining company, known as the New Hazelton Gold Cobalt Co., is reported to have shipped to Vancouver for treatment there three tons of molybdenite ore.

A measure before the Provincial Legislature has for its object giving prospectors the right to locate mineral claims in Strathcona Park, an extensive area on Vancouver Island in which the location of such claims has heretofore been prohibited.

Representatives of the chief coal-mining companies of British Columbia recently waited on the Provincial Minister of Mines and urged upon him that a proposed act he is submitting for the consideration of the local legislature, to provide for a general 8-hour day for all mine employes, both above and below ground, will result in a decreased production of coal at a time when the cry is for increased output to offset the threatened shortage of coal east of the Great Lakes.

The cost of production of coal had increased since 1907 by \$1.10 per ton, Mr. Nicol Thompson, deputy fuel controller for British Columbia, stated. While production has increased 28 per cent., wages alone had advanced 35 per cent. The average cost of coal now was \$4.50 per ton at the mine.

That 52½ per cent. of the labor employed in and about the mines on Vancouver Island is Chinese was a statement made, operators having difficulty in getting white men in view of the great labor shortage.

The Minister of Mines said the Government was anxious to increase output, but, he stated, the eight-hour day is surely coming. The Dominion Government was expecting 2,500,000 tons more this year from the West to offset the shortage in the East. He promised to give the representations every consideration.

NORTHERN ONTARIO.

Hohenour.

Work on the Hohenour claim in the Kirkland Lake district has been suspended. This property is under option to the Temiskaming Mining company. Whether or not the option is to be given up has not been officially announced as yet, but the work has been completely suspended. The plant which has been used in working the Hohenour claims was that formerly in operation at the North Dome property of the Temiskaming.

High Grade Ore at Chambers-Ferland.

The recent strike of high grade ore at the Chambers-Ferland property of the Aladdin-Cobalt Mining company is growing in importance and already a considerable amount of high grade ore has been bagged from the new vein which has been drifted on for a distance of about thirty five feet. The high grade portion of the vein is about five inches in width and carries silver

values of as much as five thousand ounces to the ton in places. The discovery of the vein was made on the 280-ft. level.

Otisse and Davidson Claims Optioned.

Two large mining deals have been made in the Fort Matatchewan district recently. The Otisse claims have been taken under option by New York interests and, according to reports, the same interests have also acquired an option on the Davidson claims. The latter were the first group in this district on which gold in spectacular quantities was encountered, and their exploration will have a more or less vital bearing on the entire field.

Kirkland Lake Gold

The general opinion of those usually well informed in matters concerning the Kirkland Lake Gold Mines, Limited, are of the opinion that work on the property will be resumed in the near future. Provided arrangements are made for the resumption of operations early this spring, the mine should be in the list of producers by late summer. The concrete foundations for the mill were placed last fall and a good deal of the machinery has arrived at the property, so that it would be possible to commence work on the milling plant within a very short time. Already there is approximately \$1,000,000 in ore reserves blocked out. One of the first developments on the re-opening of the mine will be the sinking of the new central shaft to the lower workings, which have now reached a depth of seven hundred feet. This will centralize the work and facilitate the handling of the ore more efficiently than was possible through the smaller working shaft.

Elliot-Kirkland.

Commercial ore has not yet been encountered in the lower workings of the Elliot-Kirkland, although indications are good. The proving of ore at the 400-foot level of the Elliot-Kirkland property would be significant in that it points to the possibility of the auriferous zone continuing further west than was heretofore expected. The developments on this property have also a vital bearing on the Kirkland Lake Gold, proving almost conclusively that the ore-bodies of the latter continue consistently across the property. Indeed, the persistency of the main fracture lends still further to the belief of not a few mining men that ore may be expected to continue to much greater length than as yet proven in the Kirkland Lake area.

Hollinger.

As the work of tuning up the new milling equipment at the Hollinger is progressing and working forces at the big mine increase, it is not unreasonable to expect more rapid increase in the production from this mine in the near future. So far the new milling equipment has proven highly satisfactory in every detail.

O'Donald Property Optioned.

The O'Donald property at Boston Creek has been optioned to large Detroit mining and manufacturing interests for a sum of \$250,000. This property consists of 200 acres situated between the Boston Creek Mining Company's property and that of the Patricia Syndicate and a number of veins have been encountered on the surface. Before the deal was closed sixty days' examination of the property was made by representatives of the company purchasing the property. Development work is to commence immediately and a substantial sum will be spent monthly. A portion of the claims are located in Boston Township, while the

balance runs into the township of Pecaud, and it is anticipated that some of the veins of the Patricia Syndicate and Boston Creek Mines will be picked up in the O'Donald group.

Developing Walsh Claims.

The Crown Reserve Mining Company of Cobalt is making good time in the work of developing the Walsh claims at Gowganda, on which the Crown Reserve has an option. The shaft has reached a depth of one hundred feet and a station is being cut preparatory to the commencement of lateral work.

Trethewey Orders Groch Machines.

Three Groch oil flotation machines are to be installed at the Trethewey mill, the order having been placed for the equipment this week. During recent months the installation of tube mills and other equipment has been going on and the flotation machines will be the final addition. It is anticipated that delivery will have been made by the first of May and the entire new installation will be pressed into service immediately. The new plant is designed to treat about one hundred and fifty tons per day. The impounded tailings on the Trethewey amount to 66,000 tons and the silver content runs between four and five ounces to the ton, thus it is anticipated that about 300,000 ounces will be recovered. From the treatment of this huge dump not far short of \$70,000 net profit is expected to result, although the president of the Trethewey Mining Company has estimated these profits at anywhere from \$30,000 to \$70,000.

Installing Plant at Peterson Lake.

The preparatory work for the installation of the oil flotation plant on the Peterson Lake property is under way. Excavation for the foundations and the laying of same have been commenced. Slightly used machinery has been purchased and is now being transported to the property. It is the aim of the management to have the equipment installed and in operation by June, when the work of treating the tailings from the Seneca Superior ore will be carried out.

Lake Shore Mill in Operation.

The new mill at the Lake Shore Mine at Kirkland Lake is now running on the first month's production. While awaiting the arrival of delayed portions of the equipment other portions of the plant were tuned up, so no time was lost in placing the plant in operation once the delayed portions arrived. So far everything has been found to run smoothly. The mill for the present will be treating about sixty tons per day, but provision has been made for adding to the equipment at short notice so as to almost double this capacity. A large tonnage of ore is already broken down, and the underground developments are well in advance of requirements for the present milling facilities.

Discoveries in Eby Township.

Eby Township, which corners on Teck, would appear to be in line for considerable attention this coming summer. Late last fall a discovery of gold was reported on the Adair-Sturgeon claims, since which time development work has been carried on with satisfactory results. Considerable stripping has been done on the veins and a test pit has been put down a depth of about ten feet. Channel assays taken across a satisfactory stoping width are said to assay \$3.50 per ton in gold and around eighteen ounces of silver to the ton.

McKinley-Darragh.

It is expected the annual report of the McKinley-Darragh Mining Company will be out next month. The company started the year 1917 with a cash surplus of \$264,942. It was at that time intimated by an official of the company that the satisfactory conditions at the mine tended to indicate that the year would end with the company in still further improved conditions. While the liquid assets of the company are expected to show a decline, the new flotation equipment which will be in operation on the old tailings dump will offset to a considerable degree the lower estimates of ore. The total production of silver for the year 1917 will show about 1,000,000 ounces. As silver averaged about 82 cents per ounce, which would place a value of approximately eight hundred thousand dollars. Development work at the mine is going on as usual and the physical condition of the property is far from weak.

Adanac.

Recent developments at the Adanac mine have been of a highly encouraging nature. Heretofore everything was favorable to the deposition of silver in commercial qualities, with the exception of there being insufficient shearing of the formations. At a number of points, the formation gave evidence of disturbance, in which cases silver sometimes occurred in considerable quantities and permitted of the bagging of some high-grade ore. For some time past, under the advice of Mr. Alfred R. Whitman, the eminent geologist, drifting operations have been carried towards the portion of the property a little south from the Temiskaming boundary. Conditions met with have proved almost identical with the forecast of Mr. Whitman, and the shearing now in evidence is very pronounced. According to mining men in the camp, the encountering of commercial ore in substantial quantities is not unreasonable to expect. Recently, the capitalization of the company was increased by 500,000 shares, 228,000 shares of this increased issue have been disposed of at 10 cents per share, which will afford sufficient funds for the completion of the development programme outlined by the management, and will finance the company for the balance of the year 1918.

McIntyre.

Developments at the McIntyre mine are stated to be the most favorable in the history of the mine. Making profits of close to twenty-five per cent. on the \$3,600,000 issued capital and carrying on the most extensive development campaign in its time, it is an agreeable revelation to learn that development work had reached its highest degree of importance. Before long, the main drive through the McIntyre-Extension to the Jupiter will be completed, and all these workings will be connected up at the 1,000-foot level. A miniature electric railway will be run along this drift at a depth of 1,000 feet, and regulation mine cars will be loaded from the workings above this level, as the 1,000-foot level is the main haulage way of the mine, and the ore from the upper levels finds its way through the various chutes to the cars waiting to receive their load. As far as possible, the mechanical equipment will replace manual labor in all branches of the work with an appreciable lowering of operating costs. The milling equipment at present has a capacity of about 600 tons per day. It has, however, been intimated that, at no distant future, the equipment will be increased to 1,000 tons per day. With facilities for handling 1,000 tons per day, the output of the mine would approximate \$10,000 per day, as the grade of ore being handled is

running slightly above \$10 to the ton. This production would total \$3,650,000 per year or amount to 107 per cent. on the issued capital of the company. Net profits at this mine have been running about fifty per cent. of the gross production. Thus the announcement of a further increase in the milling capacity of the mine will be reason for much satisfaction to the shareholders.

Boston Creek.

The number one shaft of the Patricia property at Boston Creek has reached a depth of over 150 feet. At the 100-foot level, upwards of 200 feet of lateral work has been done. The shear zone in which the vein occurs is wide, however, the pay streak has a width of approximately forty inches. The number two shaft has reached a depth of 100 feet and lateral work at this point is also in progress. Excavation has been commenced for the foundations of the new mill, and it is expected the mill, with a capacity of from forty to fifty tons per day will be in operation within the next three months. The average grade of ore at the property is high. About forty men are on the pay-roll of the mine.

McIntyre-Newray.

According to recent rumors, it would appear possible that McIntyre Mines of Porcupine may possibly take an option on the Newray property on a working basis. The McIntyre lies about half a mile from the Newray, with the Plenaurnum property, which is now under option to the McIntyre lying between the two. Were this to become a reality, the McIntyre property would then have a length of one and a quarter miles. The plan of development and exploration of the Newray by the McIntyre would perhaps take the form of extending the drift from the 1,300-foot level of the property through the Plenaurnum and into Newray ground, as it has recently been stated that the best possibilities of Newray will be in deep mining. The diamond drilling so far carried out on the Plenaurnum property has not been as favorable as expected, however, the exploration of this property is so far very incomplete. At the present time, all that can be said of these rumors is that the plan is feasible.

Larder Lake.

The development of the property of the Associated Goldfields Mining Company at Larder Lake is being conducted energetically. The main workings of the mine have reached a depth of 500 feet and are said to be in commercial ore. At the 100-foot level, the ore body is 130 feet in width. It is planned to crosscut at the 500-foot level for the purpose of developing the ore body at this depth. It is the intention of the management to increase their working force in the early spring to 150 men. The Associated Goldfields includes several properties and is 2,000 acres in extent. At Ravens Falls, the company have a power plant, where about 1,600 h.p. is being generated, and the head developed is sufficient to increase this by several times its present capacity. The management have not made any definite arrangements for the construction of a mill, awaiting the further development of the property to determine the equipment which will be necessary for the handling of the ore.

Otisse.

The work of breaking a road to the Otisse property is one of the first steps to be taken by the purchasers of this property. Men are being taken in for the erection of camp buildings. Mining equipment for the thorough exploration of the property is now on order, and it is hoped delivery will be made in time to permit

of using the winter road for transportation of this to the property. The company also intend diamond drilling the ore body at depth.

Craig.

Arrangements are being made for the formation of a company to explore the Craig claims in the township of Cairo, of the Fort Matachewan district. Supplies sufficient to meet the summer's requirements are also being taken in, with the intention of developing the property.

Gowganda.

The Crown Reserve Mining Company of Cobalt, working the Walsh claims in Gowganda, is reported to be meeting with favorable results. The shaft has reached a depth of 100 feet and is being continued to deeper levels. A force of about thirty men is engaged in the work, and development is being pushed ahead vigorously.

Three Stars.

A new company, known as the "Three Stars," is now developing the old Calumet and Montana mine. The old workings have been pumped out, and active operations are now under way. The main shaft of this property was formerly driven below the 200-foot level, and more or less encouraging results were met with. It is said the new company is well financed for the carrying on of aggressive development.

Work Suspended at Croesus.

Operations at the Croesus mine in Munro township have been indefinitely suspended. This announcement came as a considerable surprise to everyone, as the property is said to be the richest gold mine in the world. The decision to close down is said to be due to the fact that the mine is privately owned and the owners prefer to leave the gold unmined until economic conditions improve, when the profits will be infinitely larger than at the present time. One of the chief handicaps under which the Croesus mine has to work is the fact that coal for motive power must be hauled from the railway at Matheson, a distance of about twelve miles, and another is that the price of wood has recently been increased by the settlers in the neighborhood from whom a large supply was being obtained. It would not be surprising were the owners of this rich mine to build a transmission line to the property, possibly from the Kirkland Lake camp, pending the time when operations at the mine will again be resumed.

Hill Gold Mines.

Further additions to the machinery at the Hill Gold Mines property at Painkiller Lake have been made recently, with a view to speeding up development at the property. Like the Croesus, the main vein is not very wide, but contains highly satisfactory values. In some places the gold is visible to the naked eye, and sometimes it occurs in the form of tellurides. This company also owns a number of claims in the Boston Creek district on which considerable work has been done, with more or less encouraging results.

The La Rose Discovery.

Developments on the Violet property of the La Rose mining company, east of the O'Brien mine, are of a very important nature. The main shaft has been driven to a depth of 430 feet. At a depth of 410 feet considerable lateral work has been done. The formation is made up of diabase and Keewatin, the former overlying the latter. As is well known, the best chances of encountering ore of a commercial grade is in the horizon below where the two formations meet, and it is at this point where the LaRose is conducting the exploration and de-

velopment campaign on the Violet. So far three veins of varying depth and composition have been encountered. These veins are of a substantial width and mineralization. No intelligent estimate of their future relation to the production of the mine can at present be made. However, even in the initial stages of development the results are intensely significant, indicating the great possibility of the veins being a continuation of the auriferous zone which has yielded such a large amount of silver on the O'Brien mine. The fact that the zone carries a series of veins would appear to indicate the possibility of the veins being consistent. Further lateral work is being conducted, including the driving of a crosscut to the south.

NEW NOVA SCOTIA MANAGEMENT.

Nova Scotia Steel results in 1917 were decidedly disappointing if taken at their face value. The net for dividends of \$1,340,477 represents a heavy decline of \$764,001 or 36.4 per cent. from the previous year. Added to this is the fact that the common stock was increased 100 per cent. during the year, half by sale of new stock at par and half through a common stock dividend. In 1916 the company earned \$33.70 per share on \$7,500,000 common. In 1917 common share profits on the \$15,000,000 stock now outstanding were but \$8.40 per share, which would allow none too large a margin over the \$5 dividend rate.

The explanation of the poor showing last year lies entirely in the fact that the new management has been house-cleaning. All the cob-webs have been brushed down, the walls scrubbed and the corners bored out. The result is that the company has charged off a lot of dead items, has sweetened up its inventories, its accounts receivable, its depreciation accounts and has put its accounting system on a thoroughly modern basis.

The actual net profits of Nova Scotia Steel in 1917 were in excess of the \$2,104,478 earned in 1916. The charge-offs, however, cut down the balance for dividends to \$1,340,477.

The company has plenty of orders and unless further occasion exists to charge heavily this year Nova Scotia should make a materially better record in 1918.—Boston News Bureau.

U. S. COAL PROBLEMS.

Chicago—George H. Cushing, editor of Black Diamond, says: "The first great mistake of our war period, as to coal, has been trying to solve the problems by rule of thumb or capricious, dogmatic and academic experimenting before understanding the problems separately, or in relation to one another. We have increased coal production 110,000,000 tons over 1914. The increase should have been 75,000,000 tons more last year to satisfy all needs. In 1918 we must retain the 110,000,000 tons gained, add the 75,000,000 tons needed and to that 50,000,000 tons more to be needed, a total of 665,000,000 tons. To do this we have to get along with 125,000 fewer miners than at end of 1916, the total being 430,000, estimating a loss of 75,000 last year and 50,000 more this year. They have been drafted, or have drifted to industrial centres, where munitions and other plants pay higher wages. To offset the loss of miners we have only 50 working days available this year in excess of 250 working days we had last year, when labor disturbances were an important influence. Car supply has not increased, while the strain upon it has.

"Vice-Pres. Schoyer of Pennsylvania, after study of the car situation, assures us that only alleviation, not

correction, is possible this year, that it will take the railroads until the end of the war to catch up with their traffic. When East a few weeks ago he looked over the Pennsylvania's records and found only 100 cars hauled over the Alleghenies in one day, compared with a normal movement of 6,000. There were 5,900 actual or potential carloads piling up to dam the next day's freight current.

"Apart from direct coal requirements, we must supply from American coal enough by-products to support 1,500,000 troops shooting away the powder. We can do that quite well. We can get along without potash by using common salts, nitrates and coal tar products. But the question of coal production and distribution is very serious."

TUNGSTEN ORE DISCOVERED IN MANITOBA.

Scheelite has been found in the Falcon Lake district, Manitoba, near the molybdenite deposits discovered last fall. This tungsten ore was found by a prospector who had attended the evening classes for prospectors at the University of Manitoba. The ore was brought to the instructor, Mr. J. S. DeLury, by Mr. J. MacMillan and was identified as scheelite. It is noteworthy that the molybdenite discovery last fall was also made by a prospector who attended the evening classes at the University.

IRON AND STEEL PRICES.

Iron Age says: New York conference of iron and steel manufacturers on March 1, attended by about 75 representatives of the industry, brought out plainly the divergent interests of large and small producers as affected by government prices. While the Steel Corporation and some of the larger independent companies would probably accept without complaint a continuance of present prices, smaller producers in several lines, notably plates, show advances in costs on which they contend strongly for higher government prices after March 31.

WILL BUILD STEEL PLANT IN B.C.

Ottawa, March 16.—Arrangements have been completed by New York capitalists for the establishment of a steel plant in British Columbia. The lease has been signed in Ottawa for a tract of the Indian Reserve on the north arm of the Fraser River near New Westminster. The lease is for twenty-one years, renewable for twenty-one years more.

Work on the plant is to start in sixty days and the company is to commence with fifty tons of steel a day, the output to be increased to one hundred. Steel billets, rods, plates, etc., will be rolled. The electrical process will be used in the manufacture.

EXPECTS TO RECOVER MONTREAL MARKET FOR COAL.

Montreal, March 18.—The pessimistic views of the Hon. Mr. Armstrong, Minister of Mines, of Nova Scotia, regarding the future prospects of the Dominion Coal Company in the St. Lawrence market are not shared by Mark Workman, president of the company.

Mr. Workman, in discussing the outlook said to-day that the Dominion Coal Company would have little difficulty starting in where they left off in the St. Lawrence market, just as soon as tonnage was available to bring the coal here. He said that it was true that the business had disappeared for the present, but the quality of the Dominion Coal made it popular here; and always brought a better price here than American coal.

ORE SHIPMENTS.

During the month of February ten Cobalt companies shipped an aggregate of 26 cars of ore containing approximately 2,128,376 pounds of ore. The following is a summary of the February record:—

Shipper.	Cars.	Pounds.
Buffalo	11	928,625
Dominion Reduction	4	322,000
McKinley-Darragh	3	280,520

ROTARY MINE CARS

WILL DUMP EITHER END OR EITHER SIDE

We make these cars to order only, and to suit the customer.

We make and test two standard types, with a choice of eight sizes and shapes in each type.

We also make any other style to customer's specifications.

Prices reasonable; Delivery good.

Our general catalogue shows many other varieties of mine cars, end dump, side dump, or rotary to dump either way. Let us send you a copy.

We also make Mine Hoists, steam, electric, or belt drive; Buckets, Skips, Mine Cages, etc.

OxyAcetylene Welding and Cutting

Prest-O-Lite operator welding 6-inch nipples into steam header 14 inches in diameter.

Welded Pipe Joints Prevent Leakage

The welding of nipples into pipes, instead of using threaded fittings, is now standard practice in many plants. Welded joints are positively and permanently leak-proof, and cost less.

In repair work of all kinds, the Prest-O-Lite Process saves time and money. Repaired parts are made strong as when new, and one repair, by preventing a serious tie-up, will probably repay you the entire cost of the outfit.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

We Have Always Advocated "No Rolls" Just "One Easy Step"

AN INSTALLATION OF NO. 86 MARCY BALL-MILLS

MARCY MILL

CRUSHING
"ONE
EASY
STEP"

The modern, heavy-duty roll is an efficient ore crusher when reducing from 3 inches to 1½-inch. Actual operating cost for such work will be found to run from 6c. to 12c. per ton.

But—in crushing for concentration or flotation, rolls preceding the Marcy Mill will not increase its capacity more than 10%. To operate these rolls will cost at least one-third as much as to operate the Marcy Mills.

Therefore there is no gain in operating rolls before Marcy Mills. Save the money you would put in rolls for other purposes.

Since the Marcy Mill was introduced in 1915, two hundred mills have been manufactured and sold. Marcy Mills are now crushing more than 50,000 tons daily in nearly one hundred plants in Alaska, Canada, United States, Mexico, West Indies and South America, with entire satisfaction to their owners.

Send us your crushing problem—our engineers will gladly co-operate with you

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

- Fuel Testing Laboratory.**—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.
- Ore-Dressing Laboratory.**—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.
- Chemical Laboratory.**—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.
- Ceramic Laboratory.**—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.
- Structural Materials Laboratory.**—Experimental work on sands, cements and limes is also undertaken.
- Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

TORONTO

No. 8

THE B. GREENING WIRE CO., LIMITED
HAMILTON, CANADA

SPEED IN THE "U. V. X." TUNNEL

With Sullivan "DR6" Drills

640 feet of heading were driven at the portal end of the "U. V. X." extraction tunnel, Jerome, Arizona, during December. 58 shifts were worked, an advance of 11 feet of 11 x 10 ft. heading (and bench) per shift.

The contractors are the Potter Construction Co. They have averaged 524 feet per month since July.

This excellent progress is accomplished with three Sullivan "DR6" Water Jet Hammer Drills. Holes 13 feet deep are drilled in the hard, tight conglomerate, and are shot with 60 and 40 per cent. blasting gelatine.

Described fully in *Mine and Quarry*
No. 634—Send for your copy.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

"DDR-13" Jackhammer Sinker

The water device is of the Leyner type and mixes water with the air that is fed through the steel to the cutting face of the bit.

The water system is very effective and easily controlled.

Send for Bulletin K-205

The "Jackhammer Sinker"

For Heavy
Sinking

Dry and Wet
Patterns

This is a simple, reliable tool, fitted with automatic rotation, handy steel holder and puller, hole blowing attachment and automatic lubrication.

Some Features of the "DDR-13"

All steel construction, mostly drop forgings, heat treated.

Spring retained fronthead, reducing vibration.

A spool type of valve, simple and efficient.

Automatic heartbeat oiler, producing continuous and satisfactory lubrication.

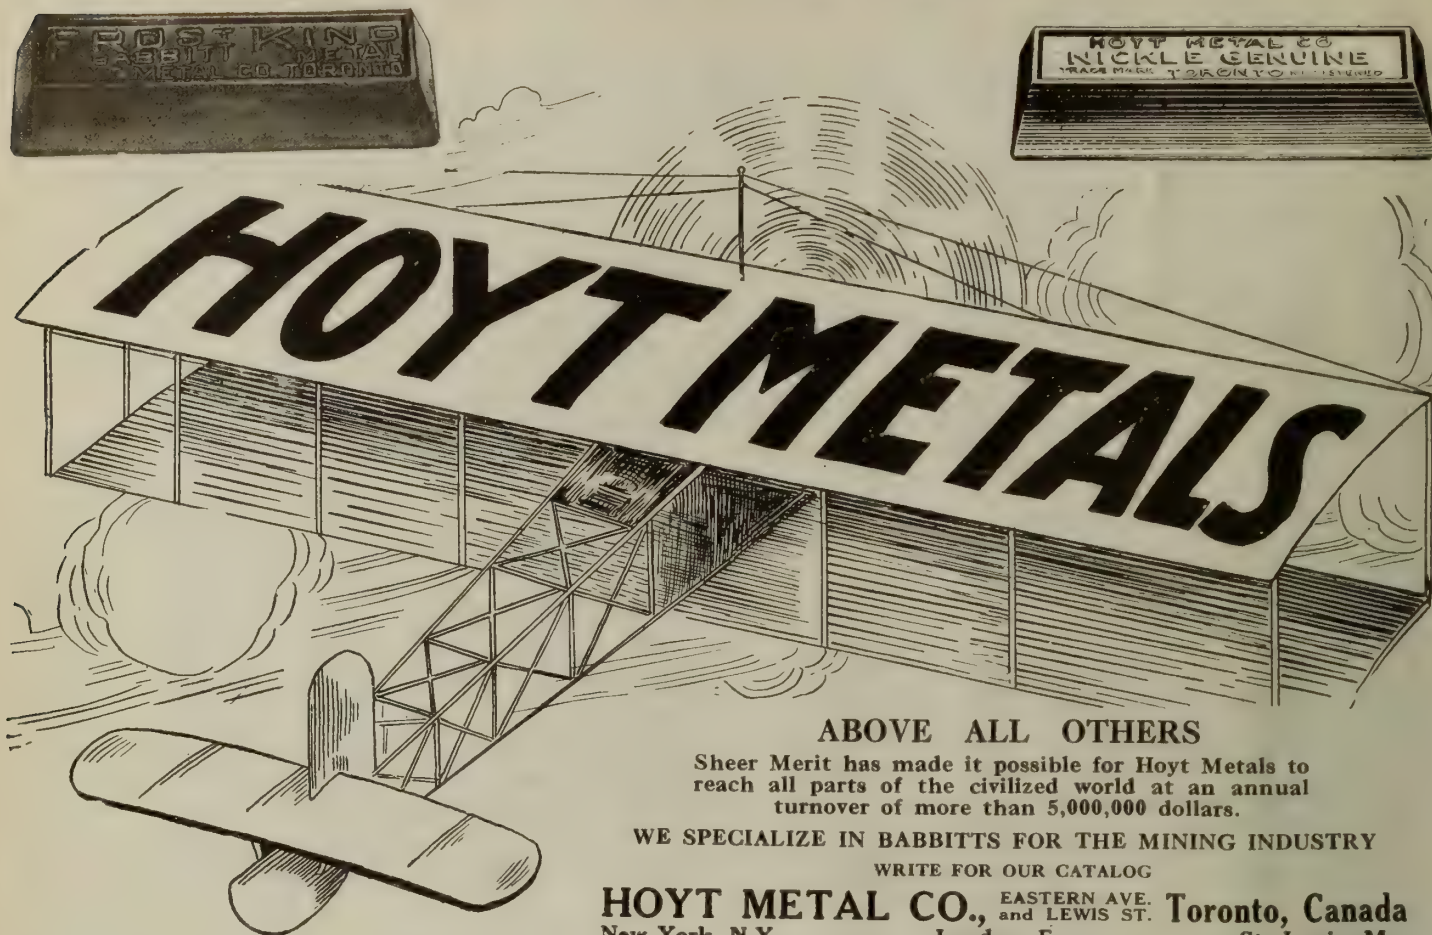

Easily drills large diameter holes to 12 feet.

"New Cleveland"

The Drill that gives Super-Service

Owners of the "New Cleveland"—and there are hundreds of them in the different mining centres of Canada—do not know what drill trouble means. From the beginning to the end of the season they stay on the job **continually**, as their solid construction requires no repairs.

They use less air and operate more smoothly than other drills, and the speed and power of the blow enables the runner to break previous records.

This means increased output at a lower cost of production, and with less labor required—a vital consideration these war times.

Use a "New Cleveland" on your job this season and put the "pleasure punch" in your work.

Write for Bulletin No. 35-A, which fully describes the "New Cleveland" Type S Stoper.

The Ross Automatic Drop-Bar Grizzly-Feeders

(Patented)

Rotary Type Installation

Travelling Type Installation

Are the solution to one of the most difficult problems in Mining and Milling operations to-day. These machines have proven their ability to automatically feed and screen run-of-mine or crushed ore at an even rate for twenty-four hours a day without attention.

Have you a feeding or screening problem? Is your present apparatus giving results?

Please send us particulars and let our Engineers submit a proposition covering your case.

Let us send you a bulletin giving interesting information regarding our machines.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

It has been made plain by Alberta coal operators that much more coal could be produced if an all year round market could be obtained. At present there is a period of several months when some of the mines must be idle. Could not the railway companies co-operate by giving a special low rate during the months that cars are not in great demand for grain? Mr. John T. Stirling, Inspector of Mines of Alberta, in his report for 1915 said: "There is no reason in my opinion why the mines in Alberta should not be supplying the Winnipeg market."

When we consider that over 4,000 employees of the Dominion Coal Company alone have enlisted, it is not surprising that the output of coal in Nova Scotia has decreased during the war. Can nothing be done to help Nova Scotia operators to secure miners to take the place of the men who are in France?

EDUCATIONAL REFORM.

During the past few years there has been more or less general recognition of the fact that capital and labor are getting so far apart that a crash must come after the war. In the years just before the war it was believed by many that a crisis would be reached in another year or two. Some believe that the war has merely postponed the crisis, the united action of men of all classes against the common enemy naturally causing differences to be more or less hidden but not removed.

Many believe that a better understanding between classes must result from the life on the battlefield, and there can be no doubt that such belief is well founded. Threats of strikes at home, strikes which might sacrifice the lives of those at the front, prevent anyone from assuming, however, that more than a temporary solution of the labor problem has been found. If differences are so difficult to reconcile while the enemy threatens, is it surprising that many expect an industrial revolution after the war?

Expectation of trouble is based on the assumption that little effort will be made to remove the differences that exist. Whether expectations are realized or not will depend on the success of those who endeavor to solve the problem that is always presenting itself. We can take it for granted that the old condition of affairs will not be accepted as satisfactory. How can a satisfactory basis be found?

Mr. C. V. Corless, of Coniston, Ontario, who has taken a keen interest in this problem for years and who has recently presented his views to members of the Canadian Mining Institute, believes that we must start at the bottom. He considers that the indispensable groundwork upon which a change for the better must be founded is a thorough social and economic training along sane lines, running through our entire educational system from common school to university. Mr. Corless' papers and addresses have attracted a great deal of favorable comment and we may expect to hear much discussion on educational reform in the near future. The Canadian Mining Institute has already taken action as a result of Mr. Corless' efforts and passed the following resolution, submitted by President A. A. Cole, at the annual meeting.

"Whereas in view of the enormous importance that capital and labor should co-operate amicably, and in view of the fact that, in the opinion of this meeting, the present antagonistic relations between capital and labor are largely the result of economic misunderstanding of the true relationship of industry to the welfare of the society as a whole; Be it resolved that this Institute endorses the general position set forth in the series of papers presented by Mr. C. V. Corless as to the necessity of educational reform as a basis for the correction of this misunderstanding; And be it further resolved that

the Secretary of the Institute be instructed to forward a copy of this resolution, with copies of the papers in question to the Engineering Institute of Canada, the Society of Chemical Industry, the Canadian Manufacturers' Association, the Pulp and Paper Association, the Textile Association, and other industrial national bodies, with the request that they consider the reform advocated, so that joint action can be taken in bringing the matter to the attention of the educational authorities of the Dominion."

CANNEL COAL.

Cannel coal has long been a will-o'-the-wisp to coal men, and to many of them its mere mention brings up visions of wealth. The reason becomes obvious when its price on the market is compared with that of ordinary bituminous coal, for in days past cannel coal has sold in the New York market at a price about three times that of the best bituminous coal and perhaps double the price of anthracite. This high price is due to old causes—strong demand and weak supply.

As a coal for use in office and household grates, as an enricher of coal gas, and as a quick-firing coal for use in fire engines and otherwise, cannel coal has filled a unique place; and these uses coupled with its scarcity in the earth have made it an object of much search and of many disappointments, because wherever it is found there has usually proved to be very little of it.

Of late years, however, fewer grates are used in the office and the home, and water gas, enriched with oil, has replaced the old type of coal gas, so that when the European war broke out the demand for cannel coal as such had largely disappeared. Then some people remembered that many years ago, before oil was struck in the country, houses were lighted with oil obtained from cannel coal. They remembered that on distillation cannel coal yielded more oil and gas than could be obtained from ordinary bituminous coal. They realized that the sudden demand for high explosives for use in the war required the utilization of the by-products formed in the distillation of coal, and they argued that if cannel coal when distilled yielded more oil and gas than other coals it should be very rich in the by-products from which benzene, toluol, and other explosive bases are made, so a demand was made for information about cannel coal. To supply this information the United States Government, through the Geological Survey, Department of the Interior, has just issued a report on the cannel coals of the United States, describing cannel coal in detail and telling where it can be found. This report refers to every place where cannel coal has been found or where it is said to occur. It contains references to nearly a hundred and fifty such places in one State alone, Kentucky.

The fact that cannel coal does yield large quantities of oil and gas is confirmed, but it is found that this oil, though suitable for ordinary burning, distills at a temperature so low that the percentage of gasoline, benzene, and other desired substances it contains is very small, and until some way has been discovered of distilling it at a higher temperature or of cracking or otherwise converting the oils found into the oils desired the distillation of cannel coal will not furnish the large supply of gasoline, benzene, toluol, and other substances that are now so greatly needed.

MOLYBDENITE IN NORWAY.

Norway has been for several years an important producer of molybdenite. At pre-war prices the industry was evidently not a profitable one; but it is said that the few regular producers are now making very large profits and dozens of new companies have been formed to take advantage of the high prices which can be obtained in Norway. In view of these reports of fabulous profits we are naturally interested in the cost of producing molybdenite in Norway. Some light on this matter was given by Mr. Ernest R. Woakes at a meeting of the Institution of Mining and Metallurgy in London on Jan. 17th, 1918. Mr. Woakes recently visited most of the molybdenite mines in Norway and he says of the cost of production "no mine produces a ton of 75 per cent. concentrates at a less cost than \$2,500, with the abnormal cost of labor, materials, etc., in Norway at the present time." If the Norwegian producers had to accept the price fixed in England and forced on Canadians by the molybdenite embargo they would soon be bankrupt.

ELECTRICAL INSPECTION AT ONTARIO MINES.

Section 37 of The Power Commission Act, as enacted by section 10 of The Power Commission Act, 1916, is amended by adding thereto the following subsection:

This section shall not apply to any mine as defined in The Mining Act of Ontario, save only as regards any dwelling-house or other building not connected with or required for mining operations or purposes or used for the treatment of ore or mineral.

DOLLAR SILVER.

Washington, April 9.—Melting into bullion of not more than 250,000,000 silver dollars now in the Treasury for sale and export, to pay trade balances, and repurchase of silver at \$1 an ounce, is proposed in an Administration bill introduced to-day by Senator Pittman of Nevada as an emergency war measure. Silver certificates would be withdrawn from circulation as the dollars are taken from the Treasury, and Federal Reserve Bank notes of new \$1 and \$2 denominations substituted. If enacted, the measure virtually would fix a standard price for silver at \$1 an ounce.

BIG GUNS.

London, April 3.—Rear-Admiral T. B. S. Adair, of the Parkhead Steel Works, Glasgow, commenting on the "mystery" gun, says that as far back as 1909 a certain 12-inch gun of Scottish design was tested at Woolwich and some very remarkable and unprecedented ballistics were obtained. The gun could easily throw a 700-pound projectile of modern contour a distance of sixty-two miles, at an expense, however, of shortening its life to about forty rounds, but it could then be relined. The recent German spectacular effect obtained with a 24-centimeter gun can be reproduced by British gunmakers whenever required.

Charles M. Schwab says: "The German gun which has been bombarding Paris may do for killing women and children at long distance, but I doubt its military value. We could make such a gun easily. It might be made practicable for certain distances, but I still believe it to be of little military use for 60 up to 100 miles. There is under construction an American gun which shoots a 16-inch projectile 59 miles. That is the gun we are building for coast defence at Sandy Hook."

Civil Engineers Discuss Fuel and Power Problems

A meeting of the Canadian Society of Civil Engineers was held in Toronto on March 26th and 27th, to discuss the fuel and power situation. A number of papers were presented at the sessions. Interesting discussions followed the reading of the papers. The program was as follows:—

Opening address, by Sir William Hearst, Prime Minister of Ontario. The Fuels of Canada, Mr. B. F. Haanel, Chief of Fuel Division, Department of Mines, Ottawa. Discussion, Mr. L. M. Arkley, M. Can. Soc. C. E., Assistant Professor of Mechanical Engineering, Toronto University. Transportation from the Fuel Viewpoint, Mr. W. N. Neal, General Secretary of The Canadian Railway Association for National Defence, Montreal, Que. The Rational Development of Canada's Coal Resources, Mr. W. J. Dick, A.M. Can. Soc. C.E., Mining Engineer of the Commission of Conservation, Ottawa, Ont. Utilization of Peat, Mr. John Blizard, A.M. Can. Soc. C.E., Technical Engineer, Division of Fuels and Fuel Testing, Mines Branch, Department of Mines, Ottawa, Ont. Discussion, Mr. James Milne, M. Can. Soc. C.E., Mechanical and Electrical Engineer, Department of Works, City of Toronto. The Low Temperature Carbonization and Briquetting of Bituminous Coals, Mr. E. Stanfield, Division of Fuels and Fuel Testing, Mines Branch, Department of Mines, Ottawa, Ont. An illustrated address on "The Erection of the Quebec Bridge," Mr. Geo. F. Porter, M. Can. Soc. C.E., Engineer of Construction, St. Lawrence Bridge Company, Montreal, Que. Premier Hearst Addresses Engineers.

Sir William Hearst extended a hearty welcome to the engineers. Sir William said he was pleased to welcome such an eminent body of scientific men, and that added interest would attend their conference because they were to discuss the fuel question. While coal had not been discovered in Ontario, there were, however, numerous waterfalls, by which power could

be developed. The resources of peat were as yet unknown, but money had been provided by the Legislature to deal with the problem and experiments would be carried out. A co-operative scheme had been agreed upon between the Dominion and Ontario Governments on the question of peat fuel, and fuel distribution had also been discussed. While the peat resources could not be relied upon for next winter, the Government had taken up the question of wood supply, and it was hoped enough wood would be secured to meet emergencies.

B. F. Haanel Urges Development of Fuel Resources.

B. F. Haanel, Chief of the Fuel Division of the Department of Mines at Ottawa, read an address upon "The Fuels of Canada." Mr. Haanel declared that if Canada was to-day largely dependent upon coal and oil from the United States, it was due to apathy toward the development of home resources, not to the scarcity of the fuel within the Dominion. "We have been culpably neglectful of our fuels," he declared. "And some day in the future we will be faced with great suffering if we do not now render our own fuel resources available." Mr. Haanel contended that Canada had fuel resources sufficient to make her independent of the United States if they were developed. He read to the engineers statistics to show how largely Canada was depending upon the States and presented estimates of her resources of coal and peat. Canada, he said, had 37,000 square miles of peat bogs. The conversion of these bogs into good commercial fuel involved no particular research work. It had been made into excellent fuel for domestic and industrial purposes for many years in European countries. In closing, Mr. Haanel advocated concerted pressure to get vigorous development of Canada's Resources.

The big item in connection with peat, in the opinion of George W. Allen, secretary-treasurer of the Canadian Gas Association, was that peat could be used for producer gas and the by-products turned into so many uses that great efficiency and economy resulted. The fact that peat could replace bituminous coal in this regard made it almost a national crime to use coal for purposes of producing gas.

W. N. Neal Tells What Railways Have Done.

W. N. Neal, general secretary of the Canadian Railway Association, was not able to be present to deliver in person his address upon "Transportation From the Fuel Standpoint." The address as read to the members was an instructive review of the problems the railways had faced and overcome in connection with the shortage of fuel. Mr. Neal estimated the haulage of coal as one-fifth of the total tonnage handled by the railways, and that coal, he stated, had been carried farther in Canada for less money than any other country in the world. It cost less to haul a ton of coal 60 miles than to team it a mile in the city of Toronto. The address told of the efforts made by the railways to relieve the coal scarcity by instituting radical economies. The reduction in the number of passenger trains had effected a saving of 600,000 tons of coal. The number of sleeping cars had been reduced, observation cars eliminated, and the freight loads increased. In closing, Mr. Neal said that the railways took a great deal of pride in their record in regard to the carrying of fuel.

W. J. Dick Suggests Improved Methods of Utilizing Our Fuel Resources.

W. J. Dick, Mining Engineer of the Commission of Conservation, spoke upon the rational development of Canada's coal resources. "Canada," he said, "has 16.4 per cent. of the world's coal, Great Britain 2.4 per cent., and the United States 51.8 per cent. The coal fields of the United States and Canada have the largest proportion of the world's resources of coal and with the exhaustion of the coal fields of Europe those countries will have to look to North America.

Mr. Dick stated that production of coal in Canada had doubled every twelve years since 1874, yet had not kept pace with the increase in consumption. Mr. Dick was of the opinion that while in the east and the west Canada had large deposits of bituminous coal, she had little anthracite for domestic use. To make up that deficiency he suggested that the future would bring with it the production of artificial anthracite made from bituminous coal with gas, ammonia and tar as valuable by-products. The municipal gas plants of to-day would form the basis of a new organization.

"It is not beyond the bounds of reason," he said, "to foresee the day when the householder, in place of his \$10 ton of coal and slate, will receive a ton of smokeless artificial coal, gas for a month, enough ammonia to fertilize a small garden and enough tar to cover the road in front of his home, all for less money than he is now paying for inferior coal." Mr. Dick contended that two million tons of coke had been used in the United States for domestic purposes, and the fact that the gas companies with small plants could produce quantities of coke showed the possibilities of the coke industry.

Mr. Dick suggested that the area to be served from the Western Canada coal fields could be enlarged by special railway rates during the season when the grain was not being moved, the coal being stored at delivery points. This would ease the drain upon imported coal and would give steadier labor conditions at the mines, an important consideration in securing increased production. Mr. Dick also advocated a pooling of interests by the mines in order to secure economic development of the coal fields.

John Blizard Discusses Utilization of Peat.

Mr. John Blizard, Technical Engineer of the Division of Fuels and Fuel Testing, of the Mines Department, in dealing with peat, expressed his opinion that it was to assume an important role in Canadian industrial life in the future. Mr. Blizard discussed at some length the methods of taking raw peat, extracting the moisture and making it commercially profitable. He gave the gathering an idea of the tremendous resources of peat that are to be found in various parts of the Dominion, particularly in Ontario. A peat bog to be a commercial proposition should be at least five feet deep. A square mile of bog, ten feet deep would contain about 800,000 tons of dry peat, or 1,100,000 tons of air dried peat with 25 per cent. moisture.

In commenting upon the possibility of peat competing in price with coal and other fuels, Mr. Blizard stated that peat, if produced in any quantity, could be made cheaply since most of the labor required was unskilled. In concluding his address, Mr. Blizard declared that the inauguration of peat fuel as an important industry in Canada could not be long delayed.

The concluding address of the Tuesday afternoon session was by E. Stanfield, of the Division of Fuels and Fuel Testing of the Mines Branch at Ottawa, on

low temperature carbonization and briquetting of bituminous coals. At the evening session, George F. Porter, Engineer of Construction for the Quebec Bridge, gave an illustrated address on the erection of the bridge.

The efforts which Ontario is making to relieve the fuel situation were dealt with by Mr. Albert Grigg, Deputy Minister of Lands, Forests and Mines. The use of wood as an emergency fuel was taken up by Mr. E. J. Zavitz, Provincial Forester, who said it was vitally necessary to educate the people in rural districts to the importance of cutting wood during the summer for winter use. Mr. Zavitz showed that fuel wood costs \$12 to \$15 a cord, and that a cord of wood in heating capacity was equal to only half a ton of coal, so that at this rate the people will be paying from \$24 to \$28 for the equivalent of a ton of coal.

Arthur Hewitt on Uses of Gas.

The importance of manufactured gas among the economic fuels on which Canada may rely was explained at the convention by Mr. Arthur Hewitt, general manager of the Consumers' Gas Company, of Toronto.

Mr. Hewitt estimated that the percentage of efficiency obtained from coal in a gas works is between 60 and 70 per cent., while that of a ton of the same fuel burned in an open fire is less than 20 per cent. In addition to the gas, many gallons of tar, from which toluol, benzine, fuel oils, acids, and dyes can be made, is recoverable. There is also retort carbon, which is used for the manufacture of carbon electrodes for searchlights, electrical steel furnaces, and other uses. Mr. Hewitt said that if gas were used for cooking exclusively in Toronto, compared with anthracite coal, there would be a saving of \$2,000,000 a year.

F. G. Clarke Points Out Advantages of Central Heating System.

Mr. F. G. Clarke, chief engineer of the Toronto Electric Light Co., advocated the use of central heating plants for towns and cities. Mr. Clarke's up-to-date heating system would necessitate steam mains laid in city streets. He says: "A well designed system as, for example, one covering that part of Toronto between the bay and College Street and from Sherbourne to Spadina Avenue, if supplied from a central plant, such as the Scott Street station of the Toronto Electric Light Co., would be able to furnish all of the heat required in the district at a cost to the users from 10 to 30 per cent. less than their present expense."

Mr. Clarke predicted that gas and briquettes made from powdered coal will replace the coal now used in Canadian cities. The powdered coal could be delivered in pipes just as oil is now being conveyed from the well to the seaboard in the United States. "The cost of the gas and the briquettes will be less than one-half, and possibly one-fourth, the present prices for gas and coal."

Canada's Water Powers Should Be Used More Fully.

"Cheap power promises to be one of this country's greatest assets in the post-bellum industrial rivalry of nations for world trade," pointed out Mr. J. B. Chalkies, Superintendent of Dominion Water-power Branch, Department of the Interior, in dealing with the relations of Canada's water-powers and their relation to the fuel situation. The great fuel reserves of Canada, supported by the water-power resources, represent a sure source of cheap power, and should, he claimed, guarantee Canada her share in world trade, provided

the varied fuel-power resources are availed of to a maximum extent.

It is axiomatic, claimed Mr. Challies,* that our heat, light and power needs must be considered as one great national problem. While the Pacific and Atlantic Provinces are self-sustaining, the Central Provinces, he said, were dependent on outside sources for coal. The "acute fuel area" is dependent for domestic requirements mainly upon Pennsylvania anthracite, and for industrial needs upon American bituminous coal, as well as upon water-power.

This "area," however, he said, could eventually be made independent of foreign fuel imports and Canada could become self-sustaining, at any rate in respect of her domestic heating requirements.

In 25 years there has been developed and put in use nearly 1,800,000 water horse-power. Only about 10 per cent. of Canada's available water-powers has been developed. If Canada is to reap full benefit from her heritage in white coal there must be a constructive liaison between the Dominion and Provincial Government administrative departments concerned in water-power matters.

Electrification of Railways Would Help.

In a paper on railway electrification, Mr. John Murphy, chief electrical engineer of the Department of Railways and Canals at Ottawa, said the elimination of the need for coal at a considerable distance from the mine is a greater measure of relief and of true conservation than increasing mine production, and thereby adding to the load of the already over-burdened railways. Reducing coal consumption automatically releases men and apparatus all along the route from the mine to the consumer, and also helps to prevent railway congestion.

Railway electrification will reduce coal consumption and haulage, and it will greatly improve traffic conditions. It seems, therefore, to be a solution of the problem.

"Railway electrification is, in my opinion, a very pressing, economic, financial and engineering problem—a problem worthy of the best attention of the most highly trained and experienced specialists," said Mr. John Murphy. "From 50 per cent. to 60 per cent. of the coal now used would be saved if electric locomotives were used."

In dealing with "The Possibilities of the Relief of Fuel Consumption in Canadian Industry by the Increased Use of Hydro-Electric Energy," Mr. J. M. Robertson, Director of the Southern Canada Power Company, Montreal, said that economic utilization of power and fuel resources would limit the present use of irreplaceable materials and promote the use of other materials whose use would conserve the assets of a community.

Electric heating is not a present economic possibility, due to high cost and lack of available power, according to Mr. P. H. Mitchell, consulting engineer, who read a paper on "The Possibilities of Lessening Fuel Consumption in Canada by Adoption of Electrical Heating."

\$5,000,000 PLATE MILL FOR SYDNEY, N.S.

Ottawa, April 4.—Additional information with respect to the Federal Government's programme for the construction of steel ships to be used in meeting the

shortage of merchant vessels on the Atlantic, and the agreement between the Government and the Dominion Iron and Steel Company looking to the construction of a plant for the rolling of ship-plates in Canada was contained in the statement of Hon. C. C. Ballantyne, Minister of Marine and Fisheries, in committee of supply in the Commons to-night.

Hon. Charles Murphy asked if the shipbuilding programme of the Imperial Munitions Board and that of the Government were in any way connected. Mr. Ballantyne replied that there was absolutely no relation between them. The Minister of Marine said that one difficulty which had confronted him when he first took into consideration the question of steel shipbuilding was that Canada had no plant for the rolling of steel plates. If Canada was to be a ship-building country it was necessary that a steel mill be established in the Dominion. He, therefore, took up with the various Canadian steel companies the question of establishing a rolling mill in the Dominion. The best proposition submitted by the Government was that of the Dominion Iron and Steel Company, of Sydney, which agreed to install a rolling mill which would cost in the neighborhood of five million dollars, all of the money to be furnished by the company.

The contract which the Government had entered into with the steel company was concluded on the following basis, the Dominion Government guaranteed to take a minimum tonnage of 50,000 plates per year for five years. The price per plate for the moment was \$4.15, but this would have to be adjusted every six months on the basis of the cost of steel ingots. The mill would run for six months, turning out steel plates, and then the price to be paid by the Government would be determined. The contract provided that no higher price than \$4.25 should be charged the Government, and if the prices of ingots went down that of steel plates should be lowered accordingly. Government accountants would be placed in the office of the company to see that the prices were adjusted correctly.

The Minister of Marine said that the new mill would probably be in operation in twelve or fifteen months. All machinery which the company had to import would have to pay duty on entering Canada, but this would be refunded to the company. Until the mill was ready to supply steel plates, the shipbuilding programme would be carried on with plates supplied from the United States. The Government had been fortunate in securing 80,000 tons of steel plates at a reasonable price through the British War Mission at Washington.

BRITISH-AMERICAN NICKEL CO.'S REFINERY.

Ottawa, April 10.—The British-America Nickel Refining Company, which has been negotiating for property on which to erect a refining plant for some time, has decided to locate on the Hull side of the Ottawa River.

It is learned that representatives of the company have purchased the property known as the old Conroy piling grounds, at Deschenes, upon which a nickel refining plant, to cost in the neighborhood of \$1,000,000, will be erected. The company will employ at least one hundred and fifty hands.

Preparations have already been made for a start on the construction of the plant as soon as the frost leaves the ground.

Accuracy in Coring with Diamond Drills

By Joseph S. Mitchell.*

The increased use of diamond drills in locating ore-bodies and mineral deposits, together with the fact that mining engineers now depend largely on their use in preliminary developments, has directed attention to the various methods and devices employed for the purpose of producing the most accurate results.

While a diamond drill, even when carelessly operated, will invariably detect the presence of minerals, engineers now demand accurate and reliable data to enable them to determine with some degree of exactness the quantity and quality of the mineral sought, so that it is possible to put the property on a definite commercial basis before development is begun and equipment purchased.

In coring minerals, it is important to use the proper core barrel for the particular kind of material to be cored. For hard, solid rocks, the single tube core barrel is regularly used and no difficulty is experienced in getting full and accurate core. This barrel consists of a single tube, as its name indicates, to which the diamond bit is connected by a taper core shell. The shell is fitted with a taper split ring core lifter, which tightens on the core as the barrel is withdrawn, due to the locking effect, when it is forced into the taper of the core shell.

The water for washing out the cuttings passes directly down, over and around the core in this type and with hard, solid core will, of course, do no harm. When the cores are soft or the formation is full of natural cleavage planes, it is desirable to protect the core against washing and also to avoid the tendency of broken core, even when hard, to wedge when subjected to the pressure of moving water.

The most usual conditions, under which special barrels are used to secure core, in such material, are those found in coal formation. It is usually customary to drill with the plain or single core barrel down to within a few feet of the point at which it is expected the coal seam will be encountered. The drilling rods are then pulled up, the plain core barrel removed and the double tube core barrel substituted for it. For many years the Sullivan swivel ball bearing tube barrel has been the type in perhaps most extended use throughout the North American coal fields, for this class of drilling. It consists of an inner and outer casing, the latter being attached to the drill rods and rotating with them. This carries the diamond bit and the core lifter at the lower end. The inner casing is suspended on ball bearings inside of this tube, and remains stationary at all times, receiving the core, which passes up through the bit and core lifter, and protecting it from the friction of the rotating parts and from the washing action of the water, which is forced down between the outer and inner barrels. The return water then comes up, outside of the outer casing.

The use of this barrel is recommended for all coal prospecting, and has been the means for securing practically full cores, in nearly all cases, where it has been employed. This type of barrel is also recommended for drilling in salt, sulphur and other materials which are friable or soluble on contact with water.

Simpler types of double-tube barrels are sometimes employed in hard mineral prospecting, when the formation is encountered at an angle, or is unusually broken, so that there is danger that the short pieces of core may be ground up and the record lost. In this design provision is made for returning part of the water through the inner tube, instead of letting it all pass up, outside of the barrel. A small opening at the top of the core barrel connects with the inner tube, and the water coming back through this tube is discharged into the hole, at this point. The lifting effect occasioned by the upward rush of the water aids to loosen and free the broken pieces of core, preventing clogging and consequent grinding of the pieces. The water ordinarily passes down between the two tubes.

In a still simpler form of barrel, sometimes used, the inner tube is rigidly attached to the outer casing, and prevents washing. This does not give as good results as the return water barrel, described above.

It is interesting to note in this connection that an important advantage of the diamond drill consists in the small size of the hole in which it bores, and the relatively small size of the cores removed. Experience of more than a third of a century has indicated that the diamond drilling process can, and does, remove, satisfactory and complete, accurate records of any mineral which it is desired to prospect in this way, with cores not exceeding two inches in diameter for friable formations, such as coal, and running down to 15-16th of an inch in diameter for hard, solid mineral formations. The small size of the drilling tools used enables much better progress to be made at a relatively lower operating cost than is possible with larger drilling equipment.

The core barrels described above are manufactured by the Sullivan Machinery Company, of Chicago, whose Canadian office is at 37 Colborne St., Toronto.

NORTHERN MANITOBA MINING NEWS.

Mandy Has 9,000 Tons Copper Ore Ready to Ship.

The Pas, April 1st.—The Mandy Mining Co. has now 9,000 tons of ore at the head of navigation, awaiting the opening of the lakes and the Saskatchewan River. It will be carried to the Pas by steamboat and barge, where it will be shipped by rail to Trail. It is expected that ore will come down at the rate of 900 tons a week during the summer. Three steamboats and six barges will be put at the work by the Ross Navigation Co. Twelve cars shipped this month to Trail were freighted by returning teams.

Diamond Drilling at Flin Flon and Cranberry Lakes.

The Flin Flon syndicate will continue drilling with three diamond drills all summer on their big property.

A Duluth concern has a diamond drill at work on some claims at Cranberry Lakes.

An option has been taken by a large eastern mining company on a group of claims at the end of Phantom Lake, south of the Flin Flon group, on which diamond drilling operations will be commenced next October.

Mill at Herb Lake Completed.

Herb Lake is also soon going to be in the limelight; the mill on the Rex is now completed and should be producing gold inside of thirty days.

The Northern Manitoba is making a shipment of ore to Trail and will probably resume work shortly.

Active development work is expected to start on several other promising properties with the advent of spring.

*Sullivan Machinery Co.

Origin of Sudbury Nickel-Copper Deposits

In a paper presented at the recent annual meeting of the Canadian Mining Institute and the American Institute of Mining Engineers, H. M. Roberts and R. D. Longyear said in part:

The genesis of the Sudbury ores has been a subject of keen debate for a number of years. The data brought to light by this exploration, which has developed one of the large orebodies of the district, lends a new emphasis to some phases of the problem, and it will be of interest to discuss in a general way the facts concerning the deposits and the various conclusions which may be drawn from them.

The apparently conflicting theories of origin are all based upon certain facts. These facts, as distinguished from inferences, are enumerated below:

1. The ore generally occurs at or near the margin of the main norite mass. Where the ore is not near the main laccolith ("offset deposits"), norite is always found associated with the ore, or in close proximity to it.

2. The ore minerals are later than the rock-forming minerals of the norite.

3. The ores penetrate and replace the foot-wall rocks to some extent.

4. The rock associated with the ore appears to be more or less brecciated.

5. The walls of the commercial orebody are usually sharply defined, mineralogically.

6. The norite wall is always spotted with sulphides. The foot wall is sometimes spotted, and sometimes barren.

7. The mineralogical content of the "marginal deposits" is singularly uniform with a fairly constant ratio between the amount of pentlandite and pyrrhotite, although with a slightly more variable quantity of chalcopyrite. The content of the "offset deposits" is not as uniform as that of the marginal deposits.

8. The usual minerals accompanying typical hydrothermal deposits are scarce or lacking, and in many places the norite associated with the ore is unaltered.

9. The norite laccolith has been differentiated into an upper stratum of acid material and a lower stratum of basic material. Within the basic material are minor amounts of acid rocks.

On the basis of these facts, a number of hypotheses concerning the genesis of the Sudbury ores have been offered. In general, they fall into two classes: those which postulate a magmatic origin, and those which postulate that the ores are the result of a later introduction by hydrothermal solutions.

The Relation Between the Exploration and Theories of Origin.

A choice between the various hypotheses is a matter of great importance to the explorer who is endeavoring to conduct a rational search for ore. Such a choice of views is important not only in reference to the value of any one parcel of land along the contact but also in regard to the handling of any one drill hole. There is one condition common to all of these theories: The orebodies that have now been found do occur along the contact of norite with some other adjacent rock. This is true not only of the sill as a whole, but of the offsets as well; although in many of the offsets, sulphides occur throughout norite dikes. Thus any lands along the norite contact might be expected to carry ore. The explorer must answer this question: Which lands among

those along the norite warrant the greatest expenditure for the purpose of finding ore? Every consideration that will help in solving this difficult problem is of great importance.

When this exploration was started, the later publications by Tolman and Rogers and by Knight were not available, but a study was made of existing publications.

In the early stages of the work, drilling was carried on, simultaneously, in various townships along the nickel range. As far as the immediate local facts in the field might show, all of these localities presented about equal opportunities for finding a body of ore. It may be of interest to record briefly the results of the exploration in the various townships, touching particularly upon the factors which determined the course of the work.

In the Township of Levack, on the north limb of the basin, three holes were drilled between the Strathcona mine and the Levack mine. The relative position of these mines led to the belief that ore might be found along the norite contact between them. Only one hole was drilled to the contact. This hole is typical of many of the holes drilled and is therefore described. It started in a uniform phase of the norite and continued in this for a depth of 500 ft. the proportion of pyroxene and basic minerals increased as the hole deepened, and many anhedral pyrrhotite appeared. Between the depths of 500 and 600 ft., portions of the core were composed largely of basic minerals; other portions were plagioclase feldspar. These segregations gave to the rock the appearance of having a gneissoid structure. Within this material were found a few occurrences of pyrrhotite and chalcopyrite, each attaining perhaps to as great a volume as 1 cu. in. At 600 ft., the drill encountered the coarse-grained, flesh-colored granite of the footwall, decidedly different from any of the rock above.

Drills working in the Township of Trill in the western part of the district and in the Townships of Denison and Blezard, encountered much the same types of norite with segregation phenomena near the contact as described in connection with the drill holes in Levack. No commercial quantities of sulphides were found, which, of course, does not necessarily mean that such bodies may not be found. Meanwhile, drills were at work in the Townships of Falconbridge and MacLennan in the eastern part of the district. Typical norite was encountered there also, after penetrating the glacial drift. The norite at the contact in Falconbridge differs in no degree from the norite encountered elsewhere, except that outcrops to the north indicate that the basic portion of the intrusive sill is wider than in the other localities where drilling was done. In attacking this region, it was planned to refrain from deep, costly rock drilling until the position of the contact had been definitely determined by "scout" holes which would merely penetrate ledge for a few feet. These were put down through the drift for the purpose of marking out the position of the contact; thus the deeper holes had a definite basis for the choosing of their location. In the early stages of the work, one hole near the contact was drilled to a depth of 600 ft. in norite but did not encounter footwall rocks, thereby indicating that the norite contact had a steep dip.

At this time, lands in the Townships of Bowell, Wisner and Graham were also available for exploration, but it was decided not to drill them. The drills were withdrawn from Levack, Trill, Denison and Blezard

and the exploration was concentrated upon the Townships of Falconbridge and MacLennan where the contact was largely concealed by glacial covering, but where, so far as known, the norite had the same mineralogical characteristics at the immediate base as the norite found during the course of the other explorations. In addition to the drilling, and while it was in progress, studies of many portions of the norite contact were made in the field wherever it was exposed to view.

As a result of this work and of a consideration of all the large field relationships as shown on the maps of the Sudbury District, the following general condition had been becoming apparent: The quantity of sulphides which may be expected to occur at the contact of the nickel-bearing intrusive is roughly proportional to the volume of the adjacent norite. The surface expanse of the nickel-bearing intrusive and its thickness as shown by the dip at the contact both go to show what the volume of the tributary nickel-bearing intrusive may be.

The one great expanse of nickel-bearing intrusive in the district which, so far as known, did not have a commensurate body of sulphides accompanying it, lay in the eastern part of the district in the Township of Falconbridge. The nickel-bearing intrusive in this vicinity has a much greater width than in the Townships of Wisner, Howell and Levaack on the north, or Trill on the west. The norite has a great width in the Townships of Denison and Blezard, but the accompanying orebodies had already been discovered; i.e., Crean Hill mine and Blezard mine. Hence, it was decided to concentrate on the contact in the Township of Falconbridge, even though it was covered by 150 to 200 ft. of gravel and boulders.

In this connection, it may be noted that in regions where the offsets are highly mineralized, the adjacent basic margin does not yield orebodies, i.e., in the region of the Worthington and Mond mines, the marginal contact of the main intrusive is quite generally exposed and no orebodies have been found along it. In the region of the Frood mine, which is found on an offset, the margin proper does not yield orebodies, indicating that the metallic content which was a portion of the magma in these vicinities, when found in one place does not occur in quantity in another portion of the "horizontal cross-section" or plan now exposed by the erosion surface. This relationship is, of course, rough, discernible only in broad outlines, but is sound evidence for the conduct of exploration, safer than speculation arising from more detailed features of any one hand specimen or any one orebody. General evidence of this kind is more likely to be a safe guide for the projection of work in unknown areas, since the reasoning proceeds from the nature of the intrusive process as a whole, not from any one phase which may be dominated by local conditions.

While the discovery of ore in Falconbridge Township as a result of assuming a relation between the volume of norite and the volume of sulphides may be only a coincidence, nevertheless, the outcome is a strong indication that some such close relationship actually does exist.

Another factor which has been emphasized by this exploration is the intimate association of the ore with the norite. In Falconbridge Township, it usually occurs at the immediate contact, the hanging-wall being entirely norite and the footwall entirely quartzite. Where the ore is actually within the quartzite (or

greenstone) it is never more than 20 or 25 ft from the base of the norite. Moreover, the drill core often shows that the gangue within the ore is norite, while the rock above and below may be quartzite or greenstone.

This is well illustrated in Hole 308, a cross-section of which is shown. Below the main body of ore, the drill passed through 16½ ft. of barren quartzite only to enter again a 2½ ft. stringer of rich ore containing small included particles of norite. The association of the norite with this last shoot of ore is extremely suggestive, and points strongly to the fact that they both came from the same source and were closely contemporaneous.

Summary.

By way of summary, a possible succession of events which produced the Sudbury ores is outlined below:

A laccolithic mass of molten rock was intruded along a plane of unconformity beneath the Animikie sediments. Through some process of differentiation, the nature of which is uncertain, this mass separated and consolidated into two distinct but intergrading types, micropegmatite and norite. The sulphides were carried downward with the norite. As the norite consolidated, these sulphides remained in solution and were concentrated in association with an acid component of the magma. This segregation or "extract" made its way to the base of the norite under the influence of complex chemical and physical forces. At the very last stage in the consolidation of the norite, the sulphides were precipitated from the "extract" along the contact, and at the same time, the acid component solidified into granite. The presence of water, sulphur, and possibly other mineralizers in the magma, gave this extract somewhat the character of a solution, enabling it to replace the wall rock to some extent. But it was still so intimately related to the magma that it was unable to carry the sulphides any great distance into the foot-wall, unless also accompanied by the molten norite.

With this point of view, it is merely a question of emphasis whether these ores are considered to be of magmatic or hydrothermal origin. The point we have tried to make clear is that the dominant factor controlling the deposition of the Sudbury ores is magmatic segregation *in situ*. Hot solutions may have been active, but only served to influence the local character and position of the ores.

THE ROSS ENGINEERING COMPANY.

The Ross Engineering Company, makers of Ross box pumps for sands and slimes, automatic drop-bar grizzly feeders and ore screening equipment and automatic dump ore car system, have opened an office at 908 Eastern Townships Bank Bldg., Montreal.

Mr. Wm. Ross, general manager of the company, is well known in many mining districts. He is a graduate of the Aberdeen Technical College, Aberdeen, Scotland. After graduating he went with Messrs. Babcock & Wilcox, Limited, where he remained for a year. He was also for a year with Messrs. Box Hall Iron Works, London, England. During the next four years he was in South Africa as chief designer of the City Deep Gold Mines, Johannesburg. From there he came to Canada five years ago. During his first year here he was mechanical engineer of mines for the Canadian Copper Co., Copper Cliff. For the next three years he was mechanical engineer for the Dome Mines, South Porcupine, and during the last year he was chief engineer for Messrs. Fraser & Chalmers.

CORRESPONDENCE

Bore-Hole Exploration.

Editor Canadian Mining Journal:

Sir,—I have read with interest the article by Mr. C. H. Hitchcock, on "Bore Hole Exploration," in your issue of January 15th, and also the letter by Mr. C. J. Harrington in your issue of March 15th, in which he takes issue with Mr. Hitchcock's statement that the "Knight and Stone" core barrel is considered the best double tube core barrel on the market.

Mr. Harrington, by his statements, proves that he is not familiar with the core barrel, which he undertakes to describe, or with the results obtained by the use of the different types of double tube core barrels.

The "Stone Patent" core barrel, which is also known as the "Knight and Stone" core barrel, is provided with means for causing a portion of the circulating water to flow back or upward through the core barrel, thus exerting pressure below the core and raising the broken pieces of rock or mineral. This prevents these pieces from being ground away on the piece of core below and therefore lost. This return water principle is not confined to the rigid type of double tube core barrel; but is also used with two different styles of ball-bearing double tube core barrels; these are shown in the patent drawings and are manufactured and sold by the Diamond Drill Contracting Company of Spokane, Wash., and the E. J. Longyear Company. However, these ball-bearing styles are recommended by the patentee and manufacturers only for very soft material, for like the Sullivan Machinery Company's type, they are short lived either in hard or alternating hard and soft material. But little if any more core can be saved with the stationary inner tube ball bearing type of core barrel in soft material than by intelligent handling can be saved with the "Stone Patent" rigid type double tube core barrel.

The "Sullivan" core barrel, like the "Stone" ball bearing type, is hung on ball bearings; but it is solidly plugged or closed at the upper end. If a piece of soft core such as clay or sticky shale is crushed in the lower end, or in any other part of the barrel, water must necessarily fill the balance of the barrel and when so confined and prevented from escaping by the crushed soft material it will act as effectually as a bar of iron in preventing the barrel from passing down over further core. If the drilling is continued all core will be ground away and lost.

With the "Stone" barrel, of either type, the water escapes freely from above the crushed piece of core and the water pressure from below assists in raising the core and freeing the block.

Mr. Harrington states that the "Sullivan" double tube core barrel is universally used for drilling in coal. I do not doubt that it is extensively used, as is all of the Sullivan machinery equipment which is widely advertised. He, however, fails to state that where this core barrel is used ninety-five per cent of the drilling is done with some other type of core barrel, usually the old single tube type, and the ball bearing core barrel is used only to cut through the coal. Whereas the "Stone" type of core barrel is used for the entire length of the hole and I have never heard of it having been superseded by any other type for drilling through the softer friable material.

Where the "Stone" core barrel has been introduced it has practically replaced all other makes, single and

double tube alike. Ninety per cent. of the drilling in the Western States and British Columbia from California to Alaska is done with the "Stone" return water types and largely with the rigid style. The advantage is not alone in the value of the core saved, for in saving a greater percentage of what may be useless hard rock core an increase in the footage drilled is made and a decrease in diamond breakage amounting from ten to fifty per cent is accomplished. This, in itself, when recognized, should cause the "Stone" return water core barrel to supplant all others.

One of the purchasers and users of the "Stone" core barrel, Mr. M. Ahearn, of Denver, Colorado, has a patent double tube core barrel without the return water feature, this is superior to the "Sullivan" double tube core barrel or any other of that type known to the writer in that the construction allows for the lubrication of the ball bearings, which are protected from the action of the circulating water. It also allows for the use of larger and stronger thrust balls.

Yours, etc.,

FRED STONE.

Box 947, Spokane, Wash., U.S.A.
March 30, 1918.

\$400,000 FOR EXPERIMENTAL PLANT.

Ottawa, April 7.—The Advisory Council for Scientific and Industrial Research has been informed by the Government that the Council's recommendation that a plant be erected in the Province of Saskatchewan for the production of a high-grade domestic fuel from the lignite of eastern Saskatchewan has been approved. The Government has provided a sum of \$400,000 for the construction and operation of this plant.

In this undertaking the Dominion Government is acting in co-operation with the Governments of the Provinces of Saskatchewan and Manitoba.

The Council has received a request from the Ontario Government asking that R. A. Ross, C.E., one of the members of the Council, be appointed to act with Arthur Cole, C.E., as a committee to take immediate steps for the development of the peat bogs of Ontario, and the production from them of a merchantable fuel. The Research Council has concurred in these appointments and the investigation will be proceeded with.

Winnipeg, April 10.—It is stated that an arrangement has been entered into between the Federal Government, the Province of Manitoba, and the Province of Saskatchewan, whereby a plant for the manufacture of anthracite briquettes from prairie lignite coal will be established in the Estevan district in Saskatchewan.

The plant will cost \$400,000, the Federal Government putting up \$200,000 and the Provinces \$100,000 each. The plant will become the property of the two Provinces on its completion. The Federal Government has charge of the erection of the plant, and it is expected that it will be in operation by next winter.

At Victoria, B.C., the Central Iron Committee has proposed that the initial objective of the British Columbia steel delegation, when it shall meet the Federal authorities in Ottawa, shall be, first and foremost, the establishment of a pig-iron plant. The construction and operation of such a plant, it is contended, may be the thin end of the wedge that will eventually shape itself into the establishment of an important iron and steel industry on the coast of British Columbia.

"The Whitley Scheme"

By C. V. Corless.

In the creation of democratic organization for unifying the aims of Capital and Labor, Great Britain is once more the pioneer. We instinctively turn to her for industrial experience, as a child turns to a wise parent. Her experience in industry is many centuries older than ours. Her labor is much more highly unionized. Her Trade Unions have passed through two centuries of struggle. Her differences between Labor and Capital are more clearly defined. Her class distinctions, for other (historical) reasons, are more marked—a fact that has added to the bitterness between Capital and Labor. These had brought the industrial dispute in Great Britain to such a stage that, by 1914, many felt that such general strikes were imminent, as would amount almost to, if they did not end in, a revolution. The war suddenly diverted attention from the quarrel. Though some domestic bickering has continued, all parties loyally joined hands in the superhuman effort against the common enemy. The war has, at least for the present, removed from Capital all self-complacency, which was a large factor in the domestic strife. The nation is already face to face with an inconceivable debt which is mounting at an appalling rate. The food supply is threatened. The nation is about to put forth its extreme exertion. There is no room now for old quarrels. Dust and cobwebs have been cleared away. England is never at her best until her back is to the wall. It required three years of war to brush away the last cobweb of self-complacency. She is now not only thoroughly aroused to fighting mood, but has had her creative energy quickened by the crisis.

In the awful throes and agony of the past year of war, Britain brought forth an industrial idea which, if broadly and wisely backed up in future by educational preparation, seems calculated to effect such a revolution in industrial relationships as will remove the malign social results of the pernicious economic policy followed since the industrial revolution of a century ago. In the blackest year of the war, just past, the British Government appointed a Commission whose principal work was to inquire into the causes of industrial unrest and to make suggestions for removing the causes of discontent. The work was quickly and thoroughly done. The whole country was divided into eight industrial areas to each of which was detailed a small Commission of three, consisting of one representative of employers, one of labor, and an impartial chairman. Their reports will prove of great economic value. While these industrial commissions were at work, a short preliminary report was sent to each by a sub-committee of the recently created Reconstruction Department, which at that time had merely the status of a committee appointed to consider the whole problem of industrial relations from the standpoint of post-war reconstruction.

The chairman of this sub-committee was Mr. Whitley, whose name, for brevity, has been attached to the committee, to the report and to the general scheme embodied in the report. The broad recommendation of the Whitley Committee was the establishment in every organized trade of an Industrial Council, repre-

senting both employers and workpeople, and having as its object "the regular consideration of matters affecting the progress and well-being of the trade from the point of view of all engaged in it, so far as is consistent with the general interest of the community." This recommendation, modestly called an "Interim Report on Joint Standing Industrial Councils," was, in June of last year, sent to each of the eight small Industrial Commissions, who quickly secured for it a consideration by more than one hundred Employers' Associations and Trade Unions all over the country. The greatest interest in the proposal was manifested both by the industrial bodies concerned and by the press. There appeared to be at once a general feeling of relief that a possible solution had been found for what had come to be regarded as practically a deadlock. Nothing could indicate better than this feeling of relief the essential soundness at heart of both employers and employed. By October the replies had been received and correlated. The answers of nearly all of the Trade Unions and of most of the Employers' Associations were "overwhelmingly in favor of the adoption" of the general principle of the Whitley Report. Backed thus, the Minister of Labor, on October 20th, informed the Employers' Associations and the Trade Unions of the decision of the Government to adopt the Whitley Report. The document announcing this decision by the Government made it clear:

- (1) that Joint Standing Industrial Councils should be established in all the well-organized industries with as little delay as possible.
- (2) that these Councils would be considered by the Government as "official standing Consultative Committees on all future questions affecting the industries which they represent" and would be the "normal channel through which the opinion and experience of an industry will be sought on all questions with which the industry is concerned," and
- (3) that the Councils are to be "independent bodies electing their own officers and free to determine their own functions and procedure with reference to the peculiar needs of each trade." These autonomous councils will thus "make possible a larger degree of self-government in industry than exists to-day."

These Joint Standing Industrial Councils, of national scope for each well-organized trade, will be supplemented by District Councils and these again by Shop Committees, on both of which masters and men will find equal representation.

The scheme has met with the approval of the Council of the Federation of British Industries, the most representative organization of employers in Great Britain, and of the Trades Union Congress, and to all appearances is in a fair way to success.

Mr. Wilson Harris is responsible for the statement that the idea of Joint Councils of masters and men originated with Mr. Malcolm Sparkes, of London, an employer in the building and allied trades. He had "laid before the men's unions in these trades a memorandum on industrial co-operation. The Painters and

Decorators took the memorandum and applied it." Their experience with the Industrial Councils already extends over about a year, and has proven their practicability. The original purpose of these Joint Councils was, to use their official statement, "to promote the continuous progressive improvement of the industry, to realize its organic unity as a great national service, and to advance the well-being and status of all connected with it." This, as a spontaneous expression of idealism by a workmen's organization, is of deep significance. The District Councils in this trade have met regularly now for about a year under the masters' chairman and the men's chairman alternately and have successfully carried out some important constructive work at various centres in the country besides averting some disputes. The Whitley Committee is said to have received the original suggestion from this memorandum by Mr. Sparkes and elaborated it. It may later prove to be true, as in many other great movements, that when the time is ripe the same idea springs up in many minds at about the same time.

On considering the question of representation a little more closely, it seems probable that the labor representatives on the District and National Councils under the Whitley Scheme will all be trade union leaders while the representatives of the Employers will all be professional managers. The workmen at the bench or lathe or loom or in the mine or elsewhere is generally not in close sympathy or close touch with either. If he is to feel a real co-operation between those who direct and those who perform the work, it will be through the Shop Committees. Success of the scheme will largely depend on perfectly frank, human intercourse between the representatives of both Councils and Committees, but above all, of the Shop Committees. If, as is hoped, "such an atmosphere will be created that trade disputes will never be carried to the breaking point," there will have to be, of necessity, the greatest sympathy, frankness and cordiality between the representatives of the workmen and of the management on these Shop Committees.

UNIONS WANT RECOGNITION.

Sydney, N.S., Apr. 3.—Upwards of 100 delegates from all the Amalgamated Mine Workers' locals in Cape Breton assembled in convention here this morning. This conference is being held to map out a plan of campaign for the labor men, who are demanding that the corporations recognize the various unions here. Representatives of the American Federation of Labor at Sydney Mines and the Amalgamated Association of Iron, Steel, and Tin Workers of Sydney, were also in attendance at the meeting. These two unions are demanding recognition from the Nova Scotia Steel and Coal Company and the Dominion Steel Corporation. To date neither corporation will recognize the Steel Workers' organizations.

STRIKE AT LETHBRIDGE.

Lethbridge, April 9.—The discharge of an alien enemy to-day at the Federal Coal Mines has resulted in a tie-up of the mines by the union. Peras, an Austrian, is the man involved. He has been an agitator of the men. The manager refused to reinstate him in response to an ultimatum from the miners. He says he will allow no alien enemy to dictate to him. The operators have violated no clause of their agreement, the manager claims.

PERSONAL

Mr. J. B. Tyrrell is at Tulsa, Oklahoma.

Mr. G. C. Bateman, manager of LaRose Mine, Cobalt, was in Toronto last week.

Mr. C. V. Corless, manager of the Mond Nickel Co., addressed the Royal Canadian Institute in Toronto on Saturday, April 6th, on "Educational Reform."

At a meeting of the Toronto Branch of the Canadian Mining Institute on Saturday, R. E. Hore was appointed as representative of the branch on the Joint Committee of Technical Organizations.

Mr. G. W. Bowen, general manager for the Western Fuel Company, operating large coal mines in Nanaimo district, Vancouver Island, B.C., went last month to San Francisco, California, on a business visit. Control of the company is held in that city.

Mr. R. R. Bruce, manager of the Paradise silver-lead mine in Windermere division of East Kootenay district, returned to British Columbia last month, after having spent part of the winter at Honolulu, Hawaiian islands.

Mr. T. W. Bingay, of Trail, B.C., comptroller for the Consolidated Mining and Smelting Company of Canada, Limited, who recently returned from a vacation trip in the United States, was in Victoria toward the end of March.

Mr. W. R. Will, a well-known owner of mining property situated near New Denver, Slovan district of British Columbia, has returned to that province after having spent the winter in Ontario.

Mr. E. P. Mathewson and Dr. A. Stansfield have been nominated as representatives of the Canadian Mining Institute on a Canadian Engineering Standards Committee.

Messrs. A. A. Cole, Wm. McInnis, D. B. Dowling, A. W. G. Wilson, Herman Donkin, T. C. Denis, W. G. Miller, J. S. DeLury, J. T. Stirling and W. Fleet Robertson, have been appointed an Advisory Board to assist the Canadian Munition Resources Commission in a survey of mineral resources.

OBITUARY.

Bernard P. McEnaney.

Toronto, April 3.—Mr. Bernard P. McEnaney, owner of the McEnaney Gold Mines, Limited, Timmins, Ont., was found dead yesterday evening in his apartments at 1251½ Sherbourne Street. He was last seen alive on Sunday afternoon, and it is presumed that he died some time during that night. Mr. McEnaney had suffered about three years ago from acute bronchial trouble, and he was then warned by his doctor of the danger of a bronchial hemorrhage. It is believed that Mr. McEnaney sustained a hemorrhage Sunday night, and that this was responsible for his death.

"Barney" McEnaney, as he was familiarly known, was an outstanding figure in the north country. Born in Mount Forest in 1857, early in life he went to Michigan and remained there for several years, engaged in copper mining. Hearing of the mineral wealth of Northern Ontario he returned to Ontario about eight years ago, but arrived too late to share in the early stakings of Cobalt. He was, however, one of the pioneers in both the Porcupine and the Lorraine mining camps, and had valuable holdings in both. His sale of the Porcupine Crown mine to the Crown Reserve was one of the features in Porcupine's early history.

The Ross Automatic Drop-Bar Grizzly Feeders

By Wm. Ross.

Ore feeders, grizzlies and screens are extremely important links in the chain of milling operations. It is on these that the crushers and other grinding machines depend for a steady flow of ore of the right size. Hitherto the close analysis granted to other milling equipment has been withheld from these machines, with the result that the mill operator is saddled with various types of faulty apparatus which are a source of continual trouble to him. Most of us are familiar with plugged grizzly, choked crusher, sledge hammer and repair gang episodes.

Many years practical study and experiment by the writer with various apparatus has resulted in the development of a machine for which is claimed the ability to **automatically feed and screen run-of-mine and crushed ore at an even rate for twenty-four hours a day without attention.**

The accompanying diagram, taken from the maker's catalogue, show the features of the rotary and travelling types of the Ross Automatic Drop-Bar Grizzly-Feeders. These diagrams show clearly the means by which the spacing of the grizzly bars is automatically increased at the underside of the apparatus.

The machines consist essentially of an apron of equally spaced grizzly bars which are fed forward under the lip of the bin opening. Every second bar, instead of being socketed at its ends, is linked to the main bar ahead of it. On reaching the discharge point these secondary grizzly bars drop down, remaining clear during the return half of the cycle, at the end of which they again automatically come into position ready for the screening and feeding operation. On the return journey to the starting point the bars do not obstruct the free passage of the fines. It should be noted here that the links carrying the secondary bars are pivoted excentrically to the main bars in such a way that the space between the adjacent bars is

automatically increased when the secondary bar drops over at the discharge point. This provides for the release of any piece of ore which might otherwise be trapped in this space. No troublesome internal fines chutes are necessary with these machines, and consequently the headroom required is very small; the discharge end of the travelling type can be elevated, thus necessitating no height allowance between the bin opening and the crusher. No other machine combines the functions of feeding, screening and elevating in such a manner.

The simplicity of construction of the Ross Grizzly-Feeders will make a strong appeal to the mill man. The rotary machine consists of two heavy cheek plates in which the main bars are journaled. The drop bars are supported by wide turned shoulders on the cheek plates. The cheek plates are keyed to heavy steel shaft which is carried by two bearings of ample size. The machine can be driven by ratchet, chain or belt. In the Travelling-bar machine the cheek flanges of the rotary type are replaced by heavy steel chains with hardened pins on which the main bars are journaled. The drop-bars are linked to the main bars, and are provided with half sockets at each end, which match the pins of each alternate chain link.

In any screening apparatus the greatest wear is caused by the abrasive action of large ore sliding over the screen bars or plates. Thus, in a revolving trommel screen ten feet long by five feet diameter, the coarse ore will slide over about one hundred feet of plate, and a piece may have tried two or three hundred holes before being discharged. The result is rapid wear of the screen and particularly the edges of the screen around the holes. Also, at the receiving end, the ore is impinged with considerable force onto the plate in a direction different to that of the plate. The Ross machine draws its own feed, which must therefore correspond in speed and direction to that of the bars. The coarse ore is carried to the discharge point without slip and consequently without wear. In most installations a speed of about twenty feet per minute is all that is necessary, and the wear caused by fines slipping through the slowly moving bars is negligible.

With regard to the self-feeding feature of the machine, it is acknowledged that the efficiency of a plant is seriously impaired if an even flow of ore from the storage bin is not maintained. A simple slide gate is not satisfactory unless constantly attended. If it is raised high enough to allow a large lump to pass, there usually results a rush of fines which flood the machine before the gate can be closed. A hanging gate, such as is shown in the accompanying cuts, works very successfully. When a large piece comes along, the gate will swing outwards temporarily to allow it to pass, returning afterwards to its normal position. In conjunction with the hanging gate, a forward motion of the feeder bars will automatically maintain a uniform flow of ore.

When the ore reaches the grizzly, the object is to, as quickly as possible, provide an escape for the fines. This is accomplished in the Ross machines—as will be clearly understood from the cuts—by applying a continuous feed of clear grizzly bars under the oncoming ore. Having passed the top screening bars, there is no possibility of the fines being trapped in the interior of the machine, because the spacing of the bars on the returning side has been doubled, and the distance between the bars has been increased three or four times. The coarse discharge from these machines will be uniform over the width of the apron, a special advantage where rolls, jaw crushers, etc., are being fed.

Over a dozen machines are already installed with screen spaces of from one-half inch to three inches, and negotiations are at present being completed for the installation of heavier machines, notably one with eight-inch screen spaces. This machine will handle very large run-of-mine ore at the rate of 350 tons per hour when the bars are moving at a speed of thirty feet per minute. The bars are three and one-half inch diameter, and the calculations show that twenty-five feet of grizzly surface will be presented to each ton of ore.

The mining world has responded promptly to the unique advantages offered by these machines, and manufacturing facilities are in full working order to meet the demand for quick shipment.

CROW'S NEST PASS COAL CO.

Toronto, April 13.—Through the combined influence of a five months' strike and the shortage of labor, 1917 was anything but a satisfactory year for the Crow's Nest Pass Coal Company, the report submitted to the annual meeting at the head office in Toronto yesterday showing the quantity of coal mined to be 504,768 tons, against 910,839 for 1916. The coke produced was 146,533 tons, compared with 268,980. In spite, however, of the marked decrease in production, the company was able to carry forward to the credit of profit and loss account the sum of \$381,103, compared with \$322,480 at the close of 1916. During the year the company spent on improvements and developments \$125,102, which included payment for the Coal Creek branch railway purchased from the Canadian Pacific Railway.

A press despatch from Whitehorse, Southern Yukon, follows: Recently fire destroyed the plant of the Copper King Company, while in operation in Whitehorse copper camp. The power-house, boiler-room, with power plant and compressor, were ruined. The Copper King property is being worked by Mr. J. P. Whitney and associates. The mine has been shipping ore steadily. Rebuilding will be commenced at once, and new equipment be obtained as soon as can be.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Decrease in Nova Scotia Coal Output.

The coal output of the Nova Scotian mines for the first quarter of the year is probably the lowest for a decade. The outputs of the Dominion Coal Company show a decline below last year to the end of March of 130,000 tons. The Allan Shaft mine of the Acadia Coal Co. is still idle, not having resumed operations since the explosion in January. The Nova Scotia Steel and Coal Co. have had interruptions to production through weather and labor troubles, as have the Inverness mines also. Generally speaking, production is at the lowest point since the early part of the war period. The best that can be hoped for during the remainder of the year is that production may be maintained. No possibility of increasing production is in sight; but there are a good many reasons to expect still further declines in outputs.

A New Coal Mines Act for Nova Scotia.

A new Coal Mines Regulation Act is before the House of Assembly. It contains a good deal of new matter, principally in relation to the use of explosives and the duties of examiners and shotfirers, no doubt suggested by the recent colliery explosions. All who work under the C. M. R. A. will welcome a consolidation and a more logical arrangement of its provisions, as from year to year amendments have been introduced, and repealed, and re-introduced, until the Act has become rather mixed up.

Some of the legislation introduced into the Nova Scotia House bears evidence of hurried and superficial preparation. A striking example was the Nova Scotia Stationary Engineers Act, recently brought down, and given what is vulgarly termed the "three months' hoist." As drafted, this Act was full of grammatical and typographical errors, and the textual contents were full of indefiniteness. The principle of the Act was praiseworthy, as similar legislation—but more carefully thought out—has been in existence in other provinces for many years.

Before legislators introduce bills, why should they not consult those men who have spent their lives in practical experience of the conditions which the draft legislation is intended to regulate? A process of consideration and re-drafting, of consultation of those interested, of comparison with similar legislation in other countries, of enquiry as to the success or non-success of similar legislation abroad, may very well, and very profitably consume two or three years, but after such a process, there would emerge legislation that would stand criticism and the test of actual application. A classical example is the Coal Mines Regulation Act of Great Britain. Passed in 1870, it was not consolidated and revised until a few years ago. Before it was issued in the new form, most exhaustive enquiries were instituted through the medium of technical societies, trades unions, coal-owners' associations, etc. The preliminary process was most exhaustive and possibly just as tiresome, but while the resulting Act probably did not please the extremists on either side, it is a workable, coherent, comprehensive piece of legislation, thoroughly well understood by all who assisted in compiling it. In its final form such an enactment represents not the opinion of legislators—which in technical matters must necessarily be faulty—but the unified embodiment of men

actively engaged and thoroughly familiar with the industrial operations the enactment in question is designed to govern.

Nova Scotia Coal Miners' Wages Increased.

The earlier part of the year witnessed rather protracted negotiations in the Sydney District over wage adjustments. The question has been satisfactorily settled at the mines of the Dominion Coal Company both in Cape Breton and at Springhill, and also at the collieries of the Acadia Coal Co., in Pictou Co., and the Inverness Mine in Cape Breton Island. An agreement was understood to have been reached between the workmen of the Nova Scotia Steel and Coal Co., and the Company, similar in scope to that on which the Dominion Coal Company settled with its workmen, but some hitch has arisen as to whether the increase offered will be cumulative upon a number of rather unusual concessions which the Scotia Company has granted within recent years, in lieu of specified adjustments on a percentage basis. It seems unlikely that any trouble will supervene of a serious nature, but at the time of writing the matter is not settled.

The increase given by the Dominion Coal Company was retroactive to the 1st of January, so that the workmen received two months' increase in a special pay envelope at one time. The increase which is under negotiation with the Scotia Company is likewise retroactive, and should the matter be happily settled, the cumulative increase for over three months will amount to a very considerable sum.

Mining Society of Nova Scotia will Resume Meetings.

The annual meeting of the Nova Scotia Mining Society is arranged for the 1st and 2nd of May. Since the very successful meeting held by the Society in April, 1914, the annual meetings have not been held in customary form, because the Society felt some impropriety in doing this under the strain of war conditions. In 1917 the annual meeting occupied only one day, and some extremely interesting and pertinent papers were read; but owing to the short session, they were not adequately discussed. A number of these papers are selected for discussion at the forthcoming annual meeting, and as advance copies have been distributed to the members, it is thought a profitable and mature discussion of the problems they present will take place. Some new papers are expected, and it is anticipated that the resumption of annual meetings of a normal character will show that the Society has not lost any prestige by its voluntary policy of retrenchment during the first few years of the war. This policy has placed the Society's finances in a much more favorable condition than they were in some years ago. The Annual Dinner will be held, but its features will be modified to conform with war times. As the meeting extends over two days, and as the visiting members must dine in any case, it has been considered advisable not to any longer deprive the members and the Society of the advantages which accompany the social features of the annual meeting. During the past three years the sum of \$100 has been annually donated to some patriotic fund as representing the saving to the Society from dispensing with the usual features of the Annual Dinner, which is probably the best justification of the action of the Executive in its policy of abstention and retrenchment.

It is anticipated that the question of affiliation between the Mining Society of Nova Scotia and the Canadian Mining Institute will receive final consideration from the Mining Society's members at the forthcoming meeting.

BRITISH COLUMBIA.

To Investigate Smelter Charges.

Continuing the agitation against the methods of the Consolidated Mining and Smelting Company in regard to charges and terms of settlement in connection with the smelting of silver-lead ores, Mr. Chas. F. Caldwell, of Kaslo, who is largely interested in mining properties in Ainsworth mining division, recently appeared before the mining committee of the Provincial Legislature, and asked, on behalf of the Independent Mine-Owners' Association, that an investigation be made into the existing situation. He claimed that the charges now made by the smelting company are unfair, and that they have been steadily increased until now they have reached a point where the smelting company absorbs all the profits.

The Victoria Daily Colonist has published the following information on this matter:

"Denial of Mr. Caldwell's statement was made by Mr. J. J. Warren, Managing Director of the Consolidated Company, who contended that the new rates, which became effective on February 1, last, would not yield to the company more than a reasonable profit.

"Mr. Warren stated the company had made an offer to allow a committee from the miners to examine its books and go into the whole matter, but this offer had not been accepted. He could not see his way to agree to a Government commission. It would cost \$30,000 to \$40,000 and would accomplish nothing. No commission could force the company to do the work at less than cost plus a reasonable profit, and this was the situation now.

"A resolution was offered by Mr. J. H. Hawthornthwaite that a commission be appointed to go into the whole matter, the commission to consist of one representative of the smelting interests, one from the miners and one from the Government. No action was taken on the motion. It will be taken up at a future meeting of the committee."

Investigation agreed upon.—Meanwhile, action by the Provincial Government seems to have been rendered unnecessary by the attitude of the Dominion Government, as reported by The Trail News, as under:

"Advices from Ottawa state that the Dominion Government has agreed to the appointment of the committee nominated by the Associated Boards of Trade to make an investigation into smelting rates of the Consolidated Company and will provide the necessary funds. It will also pay for the employment of an expert accountant and an expert metallurgist to assist the committee in making the inquiry.

"Information to this effect has been received by Mr. Fred A. Starkey, of Nelson, president of the Associated Boards of Trade of Eastern British Columbia, from Messrs. Lorne A. Campbell and W. A. Anstie, who were delegated to go to Ottawa and place the matter before the government with the request that the committee be given the powers necessary."

WEST KOOTENAY.

Ainsworth.—On March 21 the Kootenayan, published at Kaslo, included the following in its week's mining news: "After spending about \$130,000 in development on the United, Crow Fledgling, and Skyline properties, in Ainsworth camp, the A. W. McCune interests have quit that field. The reason given for the move is said to have been some friction with the unions. All of the camp materials and outfit used at the various pro-

perties is being brought down the hill and disposed of at a sacrifice."

Mr. F. R. Wolfe, of Spokane, Washington, president of the Florence Silver Mining Company, operating a mine and concentrating plant in Ainsworth camp, has been quoted in print as having said lately: "In the lowest level of the company mine near Ainsworth the best ore yet found in the mine has been uncovered. There is a full face of ore which is estimated to contain 30 per cent. lead. All ore previously mined here contained half an ounce of silver to the unit of lead, so it is believed the silver content of this newly opened ore shoot will be found to average 15 oz. of silver to the ton. Ore of this grade has occurred along the last 100 ft. of the drift on the No. 3 level, which is at a depth of about 700 ft. from the surface. For 200 ft. previously driven the ore was of a good milling grade, but not equal in value to that in the last 100 ft." Several weeks ago 209 tons of mill product was shipped to Trail by the Florence Company.

Slocan.—The Echo mine, situated above the Standard, in Silvertown camp, last month shipped 46 tons of silver-lead ore to Trail. The Ivanhoe, near Sandon, was another small shipper. The Lucky Jim has this year shipped, also to Trail, 1,016 tons, chiefly of zinc ore. The Lucky Thought, operated by the Consolidated Mining and Smelting Company under option of purchase, has shipped 85 tons lately. The Rambler-Cariboo's total this year is only 114 tons. The Surprise total is 1,142 tons. Small shippers include the Best, Freddie Lee, No. 1, and Richmond-Eureka. Shipments from Slocan City division have been very light. All the quantities just given are of ore received at Trail from the beginning of the year to March 21, inclusive. The Standard Silver-Lead Mining Co., operating near Silvertown, Slocan Lake, is stated to have been lately shipping about 1,000 tons of zinc concentrate monthly to smelting works in the United States. The Galena Farm also near Silvertown, is expected to shortly resume shipment of both silver-lead and zinc concentrates, operations having been resumed last month after suspension during the winter. There is ore in quantity at several other mines, but this is being held awaiting improvement in marketing conditions.

Nelson.—Five properties in Nelson mining division are on the Trail list of shippers for this year. The Molly Gibson, at the head of Kokanee Creek, in the north-eastern part of the division, one of the Consolidated Co.'s mines, has shipped 251 tons of silver-lead ore; the Emerald, near Salmo, 199 tons of lead ore; the Beasley-Monarch, about nine miles west of Nelson, 84 tons of copper ore. Small lots of ore have been received also from two or three properties in the southern part of the division.

Rossland.—Out of a total of 88,694 tons of ore received at Trail since the end of 1917, 51,636 tons was from mines in Rossland camp in the following proportions: Le Roi, 23,560 tons; Centre Star group, 22,333 tons; Le Roi No. 2 Co.'s Josie group, 4,607 tons; and White Bear, 1,136 tons. The Josie is the only one of the producing mines in Rossland camp not owned by Consolidated Company. The Le Roi No. 2, Ltd., also shipped ore to other smelting works for a while.

GENERAL NOTES.

Last month it was stated in Vancouver that a shipment of some 200 tons of gold and silver ore from Mexico to Ladysmith, Vancouver Island, was reshipped

south, owing to there not being any smelting works operating in the lower coast district of British Columbia at the time. The ore was brought to British Columbia owing to the shippers not being aware that the Ladysmith Smelting Corporation had suspended smelting following exhaustion of the then available supply of ore for its works. The Mexican ore was taken from Ladysmith to Vancouver, where arrangements were undertaken to reship it to San Francisco.

Hedley Reincorporated as a B.C. Company.

Announcement was made in Victoria last month to the effect that the Hedley Gold Mining Company, incorporated under the laws of the State of Delaware, is to be re-incorporated as a British Columbia company, with registered office in Victoria. This action followed a decision of the directors which was put into effect during a recent visit to Victoria of Mr. I. L. Merrill, of Los Angeles, California, president, and Mr. G. P. Jones, of Hedley, Similkameen district of British Columbia, general superintendent for the company. The Hedley Gold Mining Company has been operating for a number of years the Nickel Plate group of gold mines and a 40-stamp mill in Camp Hedley. The value of the company's output has averaged nearly \$800,000 a year, and dividends have been paid at the rate of 25 per cent. per annum for most years and 30 per cent. during two or three years.

Gold Mining on Princess Royal Island.

The following information relative to the gold mine on Princess Royal Island, which has been considerably developed in recent years by the Belmont-Canadian Mines, Ltd., understood to be an offshoot of the Tonopah-Belmont company operating in Nevada, was made public in Victoria last month: "The company has been developing this property with conspicuous success for some time past. Last month the net profit was \$30,000. The value of the production this month is expected to be between \$90,000 and \$100,000, with a net profit of about \$40,000. Lately a new tube mill has been installed, by means of which the quantity of ore milled will be increased. Mining and milling costs are \$5.30 a ton and the recovery is about 92.5 per cent or \$10 a ton. Extraction will be increased 1.5 per cent." In his last-published official report the district inspector of mines stated that "the mine proper is situated seven miles inland from the head of Surf Inlet, at an altitude of 1,000 ft. So far three distinct ore-lenses have been opened and developed to a depth of 1,000 ft. vertically from the outcrop, and more than 13,000 ft. of drifting done . . . The hydro-electric station is being built near tidewater; the structure will be composed of concrete throughout, and the plant will be capable of generating 1,500 horse-power, with a water-head of slightly more than 50 ft. A mill and concentrator with a capacity of from 250 to 500 tons is being installed at the mine; also, machine-shops, power-house, etc., which will be operated entirely by electricity transmitted from the hydro station at tidewater. Considerable clearing has been done at the mine, and a townsite laid out on which the company will erect up-to-date cottages for its employees, also stores, recreation rooms, etc. When in full operation this mine will give employment to 300 men." Since that report was made, additional development has been carried out underground, the mill and concentrator completed and operated, and shipment of mill product to smelting works in the United States is now being made. The brief comment included in the official "Preliminary Review" published in Victoria early in the current year was as follows: "The

first production from the Surf Inlet mine since its acquisition by the present owning company is interesting, and important, a considerable output being expected, the result of four months' operation. The property is equipped with a 250-ton mill which commenced milling in August. A considerable gold production in the future from this property seems assured."

The Emma mine, in Boundary district, owned and operated by the Consolidated Mining and Smelting Company, continues to ship copper ore to Trail. Its total for the current year, as at March 21, was 8,216 tons. The Iron Mask, in Kamloops mining division has made an output of 643 tons.

COAST COPPER CO., VANCOUVER ISLAND, B.C.

The Trail News, published in Trail, B.C., last month printed the following account of a recent deal in connection with the only copper-mining property on Vancouver Island, British Columbia, on which a large amount of development work has been done in quite recent years:

A mining transaction of great interest to Vancouver Island has just been consummated by the taking over of a seventh interest in the holdings of the Coast Copper Company in Quatsino mining division, by Mr. George E. Snyder, of Spokane, Wash. The consideration is understood to be about \$150,000, the shares having been transferred from Messrs. M. W. Bacon and W. E. Cullen, who are still interested in the company. The controlling interest is held by the Consolidated Mining and Smelting Company of Canada. The Coast Copper Company was organized last August.

Mr. Snyder closed the deal, which has been pending for several weeks, after conferring with Mr. J. J. Warren, managing director, and Mr. W. M. Archibald, manager of mines for the Consolidated Company, in Trail, on March 8 and 9. Speaking of the Quatsino property, in which he has great faith, Mr. Snyder said:

"I was assured by Mr. Archibald that development of the Coast Copper Co.'s property had reached a point which justified construction of a railway. He also told me a survey for the railway had been completed from Quatsino Sound to the property and that the holdings of the company had been enlarged recently.

Railway and Smelter Projected.

"Development has proceeded steadily. Mr. Archibald said the result obtained on the lower level strengthened the belief that the property would become a large and profitable producer.

"To finance the development and equipment a bond issue of \$750,000 was authorized. This sum was ample, it was calculated, to complete development, build a 12-mile railway and erect smelting works to have an

initial capacity of at least 500 tons a day. The entire bond issue was underwritten by the Consolidated Company. Only a little more than \$100,000 worth of these bonds have been issued. Approximately \$350,000 has been spent on the development and equipment.

2,940,000 Tons in Sight.

"In a report dated March 1, Mr. Bacon estimates to me that the ore in sight above the 700-foot level is 2,940,000 tons, containing more than 2 per cent. copper and \$1.25 a ton in gold and silver. As the ore has a magnetite base and is consequently self-fluxing, Mr. Bacon estimates the net profit, as soon as the property shall be adequately equipped, at \$2.60 a ton. This is on a basis of 18 cents a pound for copper. These figures show an estimated net ore reserve of \$7,644,000 above the 700-foot level on March 1, or a trifle more than \$38 a share.

"Mr. Bacon says development has been confined to the main vein and proceeded on only half its length within the property. He says there has been no diminution of ore bodies or value with increased depth, so there is basis for an expectation of an ultimate return much in excess of the foregoing estimate."

STANDARD MINING EXCHANGE.

Messrs. J. P. Bickell & Co. report the following closing quotations on the Standard Stock and Mining Exchange, April 9, 1918:

Oxy-Acetylene Welding and Cutting

Cutting 3/8 inch Sheet Steel Piling (including lock joints 2 1/2 inches thick) by the Prest-O-Lite Process

One Man Does the Work of Two In Less Time, At Less Cost

This illustration shows one man, with a Prest-O-Lite blow-pipe, cutting 3/8-inch Sheet Steel Piling, used in the construction of the protection piers of a large drawbridge. This one man handled the entire job, cutting an average of seven feet of piling per hour—an enormous saving over the old slow and costly method of sawing, which required the services of two men.

Prest-O-Lite PROCESS

offers splendid opportunities for substantial savings in manufacturing, construction and repair work.

Prest-O-Lite Oxy-Acetylene Welding and Cutting is opening the way to construction and repair operations which cannot be performed by any other process.

Employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the process quickly and easily. There is practically no line of metal manufacturing or repairing in which oxy-acetylene welding has not already established itself firmly as standard routine method.

Write for valuable illustrated literature and data on work others are doing by Prest-O-Lite Welding Process. It may point out ways to solve your problems. Address Dept. C-108.

World's Largest Makers of Dissolved Acetylene

Everything for Assay-Office and Laboratory

is included in the Massco Line of Assay-Office and Laboratory Equipment. The equipment advertised herein has been long tried out in most exacting service, and has given universal satisfaction.

The McCool Pulverizer

The McCool is designed to perform the most exacting work in grinding ore samples and preparing control pulps. Grinding is done between two discs, which remain smooth and serviceable in

use. Fineness can be regulated while the machine is in operation. Many letters from satisfied users prove McCool superiority.

The Sampson Crusher

The Samson Laboratory Crusher has no equal for simplicity. Its durability has been proven by users everywhere. The SAMSON can be opened wide for cleaning without the use of any tools, will crush hard rock, as well as sticky ores, producing an absolutely uniform product.

The Massco Assay Catalogue (600 pages) is published for distribution among assayers and chemists. Bulletins describing Lindsay Oil-Burning Furnace, McCool Pulverizer, Samson Crusher, Massco Clay Goods, Heusser Balance—sent upon request, without any obligation.

The Lindsay Oil-Burning Furnace

The Assayer can comfortably work in front of a Lindsay. This is due to the heavy walls, unique insulation and flue arrangement. An oxidizing or reducing atmosphere can be obtained in the muffle by regulating the muffle dampers. The Lindsay burner can be operated with almost any crude oil and shows great economy in oil consumption.

THE ASSAY MAN

The Geo. Taylor Hardware Ltd., Cobalt, New Liskeard and Cochrane, carry in stock Massco Clay Goods, Crucibles, Muffles, Scorifiers, Roasting Dishes, Lindsay Oil Furnaces, Heusser Balances and Samson Laboratory Crushers. Send them your inquiries.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

USERS of the Callow Cell are naturally interested in knowing how the decision of the United States Circuit Court of Appeals for the Third District, in the Miami case, will affect their interests.

As we understand the prevailing opinion of Judge Woolley in the Miami case he has interpreted the Supreme Court decision in the Hyde case as meaning that *"invention resides not alone in the critical proportion of oil, but also in air and agitation,"* and again, *"in the co-action of the critical proportion of oil and air effected by 'an agitation greater than, and different from that which had been resorted to before,' resulting in a froth concentrate of economical value,"* and further, that the Supreme Court did not limit the patent to *"agitation by mechanical means,"* but to agitation of a violent and persistent kind; *"it mixes the oil with the metal of the ore. This is old. Then, by its greater intensity and longer duration, it stirs the pulp into a froth."*

Thus, this decision of the Third Circuit Court of Appeals has a most important bearing upon the art, because it holds that the mixing of the oil with the mineral is old, but it **leaves open the use of oil in connection with aeration-cells.** Meanwhile the idea of a *"critical"* proportion of oil has been dis-

proved by practice in several mills within a short time after it was promulgated.

Judge Woolley says further, concerning the Callow Cell: *"Aeration is direct, and is not the result of or caused by agitation. On the contrary, agitation results from aeration and such agitation, though present in some measure, is not even approximately of the violence and duration of the agitation of the patent. The operation in the Callow Cell certainly possesses these distinguishing features from operation of the process where aeration is caused by agitation."*

The Court further confirms this important dictum by saying: *"If the only agitation to which the pulp was subjected (after such agitation as in the prior art was necessary to mix the oil and ore) was the agitation of the Callow Cells, we would not say that that agitation amounted to or was the equivalent of the violent agitation of the patent disclosure and constituted infringement."*

Apparently users of the Callow Cell may feel assured they do not infringe the method of agitation described in U.S. Patent No. 835,120 (less than 1% oil), No. 962,678 (soluble frothing agents), No. 1,099,699 (phenol or cresol in the cold without acid) since all three of the patents are of the same process, dependent upon a certain degree of violence and length of agitation and the production of the same characteristic froth, as set forth in their claims.

(Signed) J. M. Callow.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.

Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,

Per C. F. BUSS, Superintendent.

CXL EXPLOSIVES

THIS STAMP

MEANS QUALITY

Ammonia Dynamite is strong and serviceable.

More and more of it is being used.

Made in polar brands for winter.

Orders solicited and carefully filled.

Notably less fumes than straight Dynamite.

Insist on CXL "brands."

As safe as explosive can be made.

Sold from coast to coast.

The time sheets
tell the story,
but—are they
accurate?

his is a vital question in every industrial organization, large or small—vital because it eats into the profits. Solve it and you have eliminated the greatest adverse factor to the successful operation of your plant. Neglect it and an ever-increasing overhead expense will be the result.

Eliminate all this inaccuracy with an **International Time Recorder**

Not only does it give you an accurate, legible and unchangeable record of your pay-roll data, but it also cuts down to a minimum the time needed to make up that data.

We are the largest makers of Time Recorders in the world and our advice is at your disposal—FREE at any time.

There are over 260 different styles and types to suit every kind of business—one of which is particularly adaptable to your own business.

Write our nearest office TO-DAY, telling us the nature of your business and the number of employees. We will advise you what style of Time Recorder to install.

Balance!

The balance of the reciprocating masses and movements in the horizontal and vertical members of

Sullivan Angle Compound Air Compressors

is so perfect that a coin will stand on edge on the machine, when running at full speed, without the foundation bolt nuts.

This balance and smoothness of operation saves for useful work power lost in other types of compressors in overcoming vibration and friction. It saves foundation cost, permits lighter construction, and smaller floor space, and enables safe operation at high speeds.

Single Angle Compound Compressors are built in capacities from 400 cu. ft. to 1100—Twin units from 900 to 2600 cu. ft.

To Run a Mine Economically

it is not sufficient to have drills with a low air consumption—you must have a positive power supply. Breakdowns are expensive, so your air-compressor must be RELIABLE.

In the CIRCO Compressors all parts are specially designed for the stresses they have to meet, and the purchaser is therefore assured of years of day-in and day-out service.

Conserve Your Man Power and Reduce Operating Expenses

The first is absolutely necessary from a patriotic standpoint—the second is the first thought of every successful business man. Both can be accomplished when you install the “New Cleveland” Stoper in your mine. It has speed, with staying power and efficiency, double that of any other drill on the market. It has lower operating expenses, because of its low air consumption, and its economy in repairs, through its dropped forged parts of simple design which are practically unbreakable.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,510; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

TRANSPORTATION BUILDING
MONTREAL

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

Latest Model
No. 6 Wilfley Table

"We Have Been Highly Pleased
with their mechanical construction and metallurgical operation."

BROADWATER MILLS COMPANY
PARK CITY, UTAH

September 16, 1916.

Mine & Smelter Supply Co.,
Salt Lake City, Utah.

Referring to your recent request for an expression of our opinion regarding the Wilfley No. 6 and No. 9 Concentrating Tables, we are glad to be able to advise that we have been highly pleased with their mechanical construction and metallurgical operation.

Yours very truly,

BROADWATER MILLS CO.

By M. H. Kuryla, General Manager

This is what the Broadwater Mills write about the

WILFLEY TABLE

The endorsement quoted has been selected at random from the hundreds received from satisfied WILFLEY Users.

Numerous repeat orders from the biggest producers are a striking evidence of the Superiority of Wilfley Tables.

The WILFLEY combines *great capacity* with low operating and maintenance costs. The No. 1623 and No. 10 Wilfley riffing systems give *unusually large capacity* with *clean separation*.

Write us about your concentrating problems and our engineers will gladly recommend the equipment which will best meet your needs.

Wilfley Tables are manufactured in Canada by Wabi Iron Works, New Liskeard, Ont.

KLIM
IN POWDER FORM

IT FILLS YOUR MILK NEEDS

Klim is pure Ontario milk pasteurized separated and reduced to powder form.

It contains nothing but pure milk-solids—casein, albumen, milk sugar, and milk salts. When dissolved in water it has the natural appearance and taste of fresh liquid milk. The 10 pound tin of Klim makes forty quarts of liquid.

Klim bulks smaller and weighs less than any other form of milk and saves 70% freight charges, because it weighs that much less. It remains good indefinitely. Weather conditions do not affect it. It is the satisfactory, economical milk for camp and private home use.

Advice from the Fuel Controllers	161
House Discussion of Fuel Problem	162
Markets	164

Mr. John T. Stirling, Chief Inspector of Mines, of Alberta, says: "If all fuel consumed in the Provinces of Alberta, Saskatchewan and Manitoba was supplied from Albertan mines, as it should be, the output would be nearly doubled." The Alberta operators are ready to show that Mr. Stirling is correct. They need only the assurance that there will be a market for the coal mined.

The cutting down of imports of American coal into the Prairie Provinces would be a hardship if it were done unexpectedly. If, however, an announcement were made now as to the amount that will be available, Alberta operators could keep their mines in operation during the summer to make up the balance. Obviously it would be greatly to the advantage of both employers and employees if the Alberta mines had a large enough

FUEL AND POWER.

Fuel and power production and consumption are matters that Canadian mining and metallurgical companies are much interested in at all times. Naturally the present shortage has intensified the efforts to increase production and led to much discussion of ways and means. Among the probable results are: considerable increase in use of Canadian coal in the west; greater development of water powers; testing of peat possibilities in Ontario and briquetting of lignites in Saskatchewan. The much to be desired increase in production of coal in Nova Scotia seems far away, owing chiefly to labor shortage.

Coal mining is a big industry in Nova Scotia, Alberta and British Columbia. Power production is an important subsidiary enterprise of several metal mining and metallurgical companies. Power consumption is a failing common to all and so those companies not interested as producers are interested as consumers.

According to figures published by the Department of Mines, Canada produced 14,015,588 tons of marketable coal in 1917. We exported 1,733,156 tons and imported 20,857,460 tons.

Most of the coal imported is consumed in Central Canada, which has no coal but is close to the Pennsylvania fields. We should, and probably will later, use water power for many of the purposes for which this imported coal is put, but it would be difficult for Central Canada to get along with less coal for heating purposes than was imported last year.

In Western Canada there is an opportunity to at once cut down our imports somewhat by utilizing Western coal more extensively. Alberta mines could supply a much larger amount than they have been able to find a market for in Canada, owing to competition from imported coal and unfavorable freight rates.

The situation in the East is very discouraging. There we have plenty of coal and yet we find that the production is decreasing instead of increasing. Lack of transportation facilities long ago prevented the Nova Scotia companies from sending the normal supply to St. Lawrence ports. The labor shortage, due to the great numbers of miners enlisting, has made it impossible to obtain the desired output.

As has been pointed out many times, it would be easily possible to mine in Alberta sufficient coal to meet all the needs of Alberta, Manitoba and Saskatchewan, if it should prove impossible to import the customary amounts from the United States. Last year less than 5,000,000 tons was produced by Alberta mines that could produce about 8,000,000 tons. Owing to lack of market, it is at present impossible to keep the mines in operation continuously throughout the year, although they are sufficiently developed to make much larger

It may seem absurd that with good coal close at hand in Alberta, the people of Manitoba and Saskatchewan should be worrying about their next winter's supply. But they have cause for worry, for unless the Canadian operators are at once given assurance that American coal will not be available, they cannot undertake to keep the mines in operation during the summer months. If the usual 3,000,000 tons of American coal is imported this year, the Alberta operators will be able to dispose of only about 5,000,000 tons, and they can produce that amount in about 7 months. If, on the other hand, the operators are not immediately given assurance that 8,000,000 tons will be needed, they will have lost time that it will be impossible to make up. If imports fail, then there will be a shortage which will be more or less acute depending on the length of time lost now.

As a great deal has been said and written about methods of utilizing the lower grade coals of the West, there seems to be a rather general impression that Alberta mines cannot supply all the needs of the Prairie Provinces. It is true that a considerable portion of the coal mined in Alberta will not store and only a very small amount is anthracite.

But there is mined in Alberta, coal suitable for all industrial and domestic purposes. The statement, often made, that Alberta coal cannot be stored is, according to John T. Stirling, Chief Inspector of Mines, true only of less than one-third of the output. Mr. Stirling in a paper presented at the annual meeting of the Canadian Mining Institute in March, said: "It is being fully demonstrated every day that railway locomotives, steam plants and buildings of all kinds and sizes can use Alberta coal in Saskatchewan and Alberta with very satisfactory results, so that there appears to be no reason why the same fuel cannot be used in Manitoba."

TUBE MILL PEBBLES.

In the course of explorations in Nova Scotia last summer, Mr. A. O. Hayes, of the Geological Survey of Canada, collected samples from deposits of pebbles suitable for use in tube mills, which occur in beach deposits along the shore of Gabarus Bay, Cape Breton County. Along the north shore the pebbles are derived directly and in several coves in the vicinity of Eagle Head, from the volcanic rocks which form this rugged coast, beaches thrown up well above high tide are composed entirely of pebbles of rhyolite and similar types of rocks, several thousand tons of which could be readily loaded on vessels.

At the head of the bay, a barrier bar has been formed which contains a mixture of material, including the types mentioned above, together with granite, syenite, quartz-porphry and quartzite, derived from reworked glacial drift as well as the local volcanic rocks. Many thousand tons of this material could be sorted from this beach, and loaded on vessels by means of small boats, as the water is shallow in the vicinity of this bar.

A series of careful comparative tests were made in a Deval abrasion machine on samples of rhyolite pebbles, the mixed material, and of commercial flint pebbles. In regard to resistance to abrasion, all the samples proved superior to the commercial flint pebbles.

Louisburg, the terminal of the Sydney and Louisburg Railway, is about ten miles eastward from the head of Gabarus Bay, connected by a very rough wagon road; and Sydney, the terminal of the Canadian Government railway, is about twenty miles northward, with a better wagon road.

NAMES OF NEW GOLD TOWNSHIPS SOUTH OF LAKE ABITIBI.

During the autumn of 1917 gold was discovered in unsurveyed territory south of Lake Abitibi in north-eastern Ontario. This area lies about 70 miles almost directly east of the well known Porcupine area.

During the coming summer the Ontario Bureau of Mines is to make a geological survey of this new gold area. Following the custom of Ontario, this area is being divided into townships, 6 miles square. These townships have recently been given the following names in honor of men well known in the mining and geological world. In alphabetical order the names are as follows:

Frecheville—Prof. Wm. Frecheville, Professor of Mining in the Royal School of Mines, London; past President of the Institution of Mining and Metallurgy.

Garrison—Mr. F. Lynwood Garrison, Mining Engineer, Philadelphia, Pa.

Harker—Dr. Alfred Harker, F.R.S., immediate past President of the Geological Society of London.

Holloway—The late Mr. George T. Holloway, Chairman of the Royal Ontario Nickel Commission, 1915-17.

Lamplugh—Mr. G. W. Lamplugh, F.R.S., President of the Geological Society of London.

Marriott—Mr. Hugh F. Marriott, President of the Institution of Mining and Metallurgy, London.

Rand—Mr. Chas. F. Rand, past President of the American Institute of Mining Engineers, New York.

Stoughton—Dr. Bradley Stoughton, Secretary, American Institute of Mining Engineers, New York.

Mr. E. H. Hamilton, who for some time had been metallurgical manager for the Consolidated Mining and Smelting Company of Canada, at its smelting works and refineries at Trail, B.C., has left British Columbia, and is now with the United States Smelting Co. at Midvale, Utah.

Mr. J. B. Tyrrell has left for northern British Columbia, where he expects to spend a few weeks.

Major R. W. Brock is president of the Canadian Soldiers' College at Seaforth, Sussex, England. Major Davis is head of the Department of Engineering.

Mr. E. B. Schley, of New York City, has succeeded his father, the late Mr. Grant B. Schley, as president of the company operating the Britannia mines and concentrating plants near Britannia Beach, Vancouver mining division of Howe Sound, British Columbia.

Mr. Harold Grant is in charge of development work being done on some copper claims at Sooke, Victoria mining division of British Columbia, Vancouver Island. The property is being explored for the Ladysmith Smelting Corporation, under an option of purchase.

CORRESPONDENCE

High Grade Coals in Alberta.

Editor, Canadian Mining Journal:

Sir,—A letter, dated the 8th of February, 1918, from Kingston, Ont., having appeared in the March edition of the Canadian Mining Institute Bulletin, opens up a very important subject not indicated by the title. The writer, Mr. J. C. Gwillim, says, "We are inclined, now-a-days, to resent the alienation or private control of some of our natural resources. Yet we are, or were, least concerned about the two most vital ones, food and fuel. . . . It is left to the coal miners alone to produce enough fuel. . . . Soon we may expect to receive little or no hard coal from Pennsylvania; it is being exhausted and will be conserved by the American people."

The total coal output of Canada last year was about fourteen million tons, and our import of coal from the United States about seventeen million tons, of which four million tons was anthracite or hard coal, and the balance bituminous.

Mr. Gwillim asks where should we be if the United States stopped the exportation of coal to Canada? The present writer has recently as well as previously suggested, that very unpleasant things might happen in Canada if a serious strike occurred on the railways or at the collieries in the United States.

The above three possibilities would all be equally serious and therefore the sooner we people on the Canadian side of the line face the music the sooner will common sense place us in an independent position. We must, however, give the United States and its fuel controller our grateful thanks for the brotherly way in which this problem was dealt with during the past winter.

Western Canada possesses the most magnificent coal-fields, filled with seams of all qualities and which are in thickness also unequalled anywhere else on this earth.

Mr. John Stirling, the Chief Inspector of Mines for Alberta, in reference to the possible output of the Province of Alberta, tells us that the possible output might have been over eight million tons, whereas, it only amounted to about 4,863,414 in 1917, or 214,810 tons in excess of 1916.

A recently issued estimate of the coal resources of Canada made by Mr. White, of the Dominion Conservation Board, gave the Province of Saskatchewan credit for a store of over sixty-six billion tons of lignite. Experiments having been made by the Dominion Government, in conjunction with the Advisory Council of Scientific and Industrial Research it has been stated that they will erect a works to treat this and other lignite deposits, and convert them into coked or cindered coal, after extracting the by-products, and will finally convert them into briquettes equal to anthracite. This scheme if it works out successfully, may to some extent relieve the situation in that part of the Dominion.

Mr. White does not credit Alberta with the possession of any stores of anthracite, but he does credit that Province with 846 million tons of semi-anthracite, and 932 billion tons of sub-bituminous. As no details of these estimates are given, it is impossible to question his figures in detail. We will be satisfied for the moment to find that he credits the Province with some semi-anthracite, which for general purposes is a much more useful quality of coal than anthracite.

Now for a few facts, there are between Bankhead and to at least as far as the divide between the Kananaskis and Elk valleys, several coalfields containing the

most magnificent deposits of coal to be seen anywhere, and the writer has in mind one of these where it is probable that twelve and a half per cent. of the whole mountain is coal.

We are fortunate to have one man out here in the woolly west, W. P. Burns, of Calgary, who, recognizing the value of this vast wealth of coal, will without delay demonstrate that Alberta can supply a huge tonnage of very high grade anthracitic coal. Before the summer comes, Mr. Burns' mining staff will be at work, and his railway engineers will be as busy as bees laying a full gauge railway track from Okotoks to the Sheep Creek coal mines, a distance of about 55 miles.

To make sure that the following details of this property are correct, they have been submitted to Mr. Alexander Sharp, Mr. Burns' mining engineer.

The property is in a synclinal basin form, and is of Cretaceous age. To those who do not know its exact location it may be stated that it lies to the south-east of Mt. Rae, and to the east of the Misty range of mountains. Here Mr. Burns owns 12,000 acres of Crown granted land and minerals extending over a distance of eleven miles. Practically the whole of this area is coal bearing and at least a dozen workable coal seams have been prospected, which are all of workable size and quality.

The property lies at an elevation of over 5,000 feet above sea level, and therefore the coal will have a down grade to its markets.

A large number of analyses have been made, but the following will be sufficient to convince the sceptical that there are high class seams of anthracitic and bituminous coals in this field:

Number.	Moisture.	Volatile Combustible.	Fixed Carbon.	Ash.
4	1.00	12.5	82.00	3.5
5	1.00	12.50	82.00	3.50
7	1.00	11.10	81.10	6.00
14	1.82	11.74	82.25	4.20
17	1.20	15.30	75.25	7.25
16	2.00	25.00	70.00	3.00

No. 5 sample gave a very high result in British Thermal Units, viz., 14,877, one pound of it evaporating 15.4 lb. of water. Its high class quality will be better realized by comparing it with other anthracite coals, thus:

South Wales anthracite	14,884 B. T. Units
Burns anthracite	14,877 B. T. Units
Banff anthracite	14,000 B. T. Units
Pennsylvania anthracite	13,999 B. T. Units

If we adopt the classification of Mr. Dana, a well-known authority on coal, a good anthracite should contain from 78 to 88 per cent. of fixed carbon and, therefore, the first four analyses would show them to be anthracitic. Mr. D. B. Dowling's—President of the Canadian Mining Institute—is probably the best known of any of those used for the classification of coals, viz.:

Fixed Carbon + $\frac{1}{2}$ the Volatile Combustible

Moisture + $\frac{1}{2}$ the Volatile Combustible

and under this rule 15 and upwards ranks as anthracite, 13-15 as semi-anthracite, 3.5 to 6 as bituminous, and a higher class bituminous as 6 to 10. No. 16 in the above table gave a yield of 73% of coke, which in its turn gave a fixed carbon content of 94.9%.

How many hundreds of millions of tons of similar coals are to be found in this part of Alberta between the Elk divide and Bankhead it is at present impossible to say, but only railway communication and cheap freight rates are required to open it up to supply all the needs of the prairie provinces.

Although the writer has taken Mr. Gwillim's letter as his text, he does not propose to discuss costs in the way Mr. Gwillim has done; but the latter may find some comfort in the fact that the cost of working the coalfield in question is not likely to be excessive. The writer entirely agrees with Mr. Gwillim in the suggestion that the getting of coal is capable of much improvement in methods of working, which are often very wasteful.

Yours, etc.,

JAMES ASHWORTH.

Vancouver, April 11th, 1918.

LORD HYLTON MAKES STATEMENT CONCERNING MINERALS SEPARATION CORPORATIONS.

The Times, London, on March 14, printed the following account of a question and reply in the House of Lords concerning the Minerals Separation Corporations:

Lord Sydenham asked two questions concerning a German firm: (1) Whether the American branch of Messrs. Beer, Sondheimer and Co., of Frankfort, was blacklisted and subsequently released; and (2) what conditions were imposed when this branch of the German firm was permitted to act for a time as agents of Minerals Separation American Syndicate.

Lord Hylton, who replied, said the information which the Government had was to the effect that Messrs. Beer, Sondheimer and Co., of New York, were included in the statutory list, generally called, he thought, the black list in the United States, in July, 1916, and remained on that list until it was withdrawn on the entry of the United States into the war. It is perfectly true the Minerals Separation American Syndicate (1913) (Limited), which is a British registered company, entered into an agreement in the month of September, 1913, with Messrs. Beer, Sondheimer and Co., under which the firm were appointed the sole agents of the syndicate for the transaction of all commercial affairs of the Syndicate in the United States of America, Canada, Mexico, Cuba, and the Philippine Islands. Messrs. Beer, Sondheimer and Co. have their principal office at Frankfort, and have a branch in America carried on by Messrs. Benno Elkan and Otto Frohnknecht, who were resident and domiciled in New York City. In October, 1914, the syndicate applied to the Committee on Trading with the Enemy for leave to enter into an agreement with Benno Elkan and Otto Frohnknecht, under which the syndicate appointed them as the American branch of Beer, Sondheimer and Co., its sole and exclusive agents for the transaction of the commercial affairs of the syndicate in the places already mentioned, and Elkan and Frohnknecht undertook not to pay or to cause to be paid any money, etc., arising from or in connection with their trade relationship with the syndicate to Beer, Sondheimer and Co., of Frankfort, or any person resident in Germany or Austria, or to anyone for the use of such person during the war, and to defer until after the war any commission or remuneration payable to them. At that time Beer, Sondheimer and Co., of New York, were not blacklisted, and no authority was required by the syndicate to enable

them to enter into the proposed contract. They were informed by the Committee that there was no objection to their doing so.

In June, 1916, the syndicate approached the Treasury again. In view of their difficulties in America they had been advised to form an American Corporation to acquire from the syndicate the United States Patents and the Patents for Canada, Mexico, etc., and all their assets and other rights, but they were prejudiced by the Agency Agreement entered into with Benno Elkan and Otto Frohnknecht, the American Corporation which was proposed being unwilling to submit to the obligation to deal with them. The syndicate, therefore, proposed to invite Elkan and Frohnknecht to cancel the agreement in return for a certain number of fully-paid shares in the company and an option to subscribe at par for further shares. The shares in question were ultimately to be converted into shares in the American Corporation, and no benefit was to accrue in respect of them for five years. The substitution of a moderate shareholding interest in the company—£17,500 out of £200,000—appeared to be preferable to the control resulting from the exclusive agency under the Agreement of 1914, and, after reference to the Board of Trade, the Syndicate's proposal was sanctioned, subject, of course, to the approval of the Capital Issues Committee of the issue of shares if a new issue was involved. Meanwhile, the syndicate received from America the agreement entered into there for the formation of an American Corporation for the acquisition of its undertaking and assets, as finally settled. This agreement necessitated a modification of the proposed agreement with Elkan and Frohnknecht, putting an end to their exclusive agency. The shares which they were to receive as consideration for cancellation were to be placed at their disposal at the end of the war instead of at the end of five years, and Elkan and Frohnknecht were to be the general agents in the countries which I have mentioned, although not the exclusive agents, of the American company. On the other hand, they released to the British company the money to which they were entitled in respect of commission, which was stated to amount to from £16,000 to £20,000. The company stated that it was absolutely essential to continue this provision as to the agency, Elkan and Frohnknecht absolutely refusing to assent to its cancellation, and they pointed out that a leading American counsel had advised, in America, that the American branch of Beer, Sondheimer and Co. had no authority to enter into the new agreement or give the guarantee as to no-enemy benefit, and that the original agency agreement of 1913 was still in existence and could be enforced against the syndicate in the American Courts. Meanwhile the name of Beer, Sondheimer and Company of New York had been added to the statutory list. In all the circumstances the Treasury came to the conclusion that it was advisable in the national interest to authorize the company to enter into the agreement of August 4, 1916, with Elkan and Frohnknecht, even though their right to be appointed agents remained, rather than to leave the company under their liability of the 1913 and 1914 agreements to employ them as sole and exclusive agents, and sanction was accordingly given, so far as the Acts and Proclamations relating to Trading with the Enemy were concerned. The Capital Issues Committee subsequently recommended the issue of fresh shares, out of which inter alia the shares to which Elkan and Frohnknecht were entitled, were allotted to them.

By J. B. Challies.

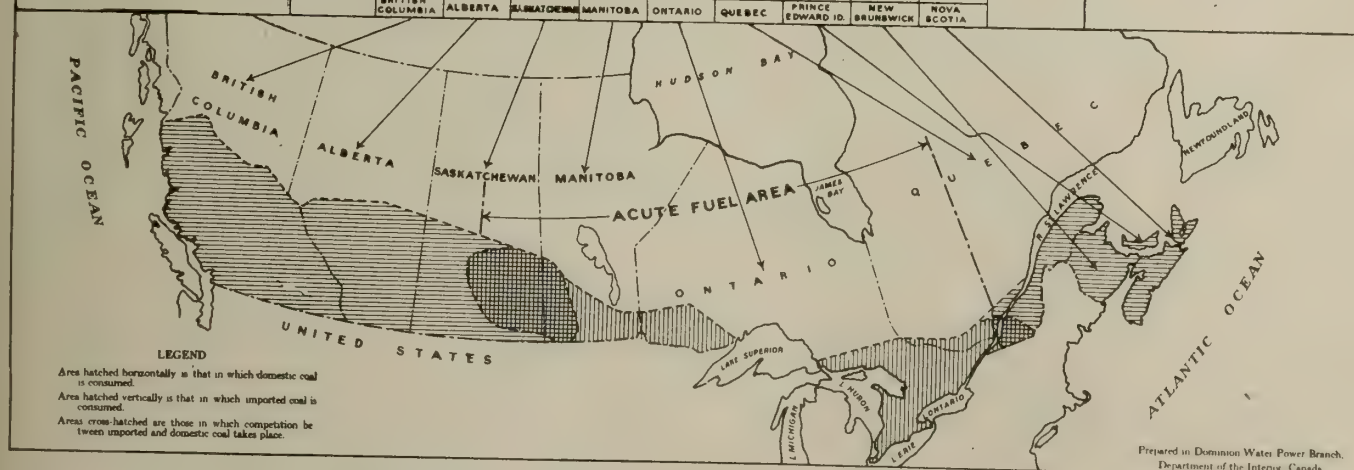

At first "blush" it might appear that water power has only an indirect and limited connection with the recent critical fuel shortage, which through suspended effort has caused temporary industrial stagnation and local domestic hardships of enormous extent and involving great financial loss. Even a casual general survey of our fuel-power requirements, however, will indicate that not only has water power a very direct and important bearing on the present situation, but that water power must, in the future, take a very much greater share in our fuel-power burdens.

I propose to show: First—That water power must take a very prominent part, if the best use of the varied fuel-power resources of Canada is to be achieved, and Second—That there must be evolved a national master fuel-power policy which will realize the best possible co-ordinated and concomitant development and use of all the fuel-power resources of the Dominion.

Plate No. 1 represents the coal consumption and production in Canada. The tabulated statement on the top of the plate summarizes the consumption in the various provinces of the different classes of coals, both domestic and imported. The greatest consumption is in central Canada, including the provinces of Manitoba, Ontario and Quebec. Coal production is greatest in the extreme western and eastern provinces. British Columbia and Alberta on the one hand and Nova Scotia

NOTE: Basic data compiled and tabulated by J. F. S. Brown, Mining Engineer.

Development along independent and divergent lines has, in the past, prevented adequate correlation of the great Canadian industries of fuel production and hydro-power supply. There is now, however, as a result of the fuel shortage, a consensus of opinion among men familiar with fuel and hydro-power matters in Canada, that there is between these allied industries enormous scope for national co-operation which would be conducive to their mutual advantage, as well as to the common weal.

on the other not only meet their own coal requirements, but produce a very considerable overplus for consumption in the contiguous portions of Central Canada. The central provinces, Manitoba, Ontario and Quebec, are almost wholly dependent on outside sources, mainly imported coals. This is clearly shown by the hatched areas on the map, the horizontal hatching covering the areas which produce their own needs, the vertical hatching covering the areas which are dependent. Where there is cross-hatching both Canadian and imported

*Extracts from a paper presented at the First General Professional Meeting of the Canadian Society of Civil Engineers for the discussion of the Present Fuel and Power Situation, Toronto March 26-27, 1918.

coals are consumed. It is to be observed that Central Canada, where consumption is greatest, is non-productive. This I have termed the "acute fuel area" of Canada.

Canada Imports Coal and Exports Coal and Electric Energy.

This "acute fuel area" is now dependent for domestic requirements mainly upon Pennsylvania anthracite and for industrial needs upon American bituminous coals, as well as upon Canadian water power. So far as domestic heating requirements are concerned, Mr. Dick, the Consulting Mining Engineer of the Conservative Commission, in his paper on the "Rational Development of Canadian Coal Resources" has pointed out the possibilities of the Western portion of the "acute fuel area" being furnished with briquetted lignite from the prairie provinces. Mr. Stansfield of the Dominion Mines Branch, in his paper on "The Low Temperature Carbonization and Briquetting of Bituminous Coal," has pointed out the possibilities of meeting the domestic heating requirements of the Eastern portion of the "acute fuel area" by the product from the low temperature carbonization of Nova Scotia bituminous coals. Although both these processes are proven to be practicable, they are as yet in their formative or agitational stage and some considerable time must elapse before

they can be placed on a commercial basis to furnish sufficient fuel to substitute for any large portion of the Pennsylvania anthracite now imported for domestic heating. There is at the present time no available supply, even in small quantities, of a Canadian coal fuel to take the place of imported anthracite. Nevertheless, this "acute fuel area" can eventually be made independent of foreign fuel imports and Canada can become self-sustaining, at any rate, in respect of her domestic heating requirements. There must, as a necessary preliminary, be a national, co-ordinated development and use of all the available fuel and power producing agencies in the Dominion. Such a co-ordination must be a matter of gradual evolution and adoption, and will, to a great extent hinge on whether Canada can reasonably expect assured fuel imports from the United States for a considerable period in the future.

As we are now exporting large quantities of coals from British Columbia and Nova Scotia into adjacent States of the Union and as we are also exporting about 275,000 horse power of electric energy, equal in value to about 3,000,000 tons of coal, it is obvious the United States cannot afford to place a sudden and complete embargo on coal exportation to Canada. The two countries must deal with each other, at least, upon a basis of quid pro quo. Providing Canada has her own fuel resources under strict national control, this power exportation should assure her an importation of sufficient coal to tide over any readjustment period necessary to permit of an ultimate dependence on Canadian sources of fuel and power.

The exportation in the past of Canadian electric energy has not been without compensating advantages. An assured United States market for Canadian power loads has enabled the financing and completion of several hydro-electric projects, the construction of which, so far as domestic markets alone are concerned, would not have been warranted at the time. The initial United States power load has, therefore, made it possible for the domestic market to reap all the benefits of available hydro-electric energy many years sooner than otherwise would have been possible.

While Canada has been receiving far more value in her coal importation than she has given in her power exportation the advantage is rapidly disappearing. It is reasonable to expect that the tendency will be for hydro-power exportation to increase and for coal importation to decrease. The time may come, and in the near future, when the balance will be against Canada.

It is, therefore, imperative that every proposal for increase in the exportation of power be carefully considered from a broad, national standpoint. Such consideration involves the evolution of a formula with regard to power exportations which will have cognizance of Canada's fuel-power needs generally.

We must face the fact that for some time to come we shall require to import United States coal, and that in turn therefor we can, under proper conditions of recovery safely and profitably export some of our surplus hydro-electric energy.

Mr. B. F. Haanel, Chief of the Fuel Testing Division, Department of Mines, in his clear and comprehensive paper on the "Fuels of Canada," describes the nature, location and extent of our varied, available fuel resources. Mr. Haanel affirms that, while the problems associated with the distribution of fuel to the various parts of Canada are exceedingly complex and the strictest conservation must be practised, the Dominion is endowed with fuel deposits on such a magnificent

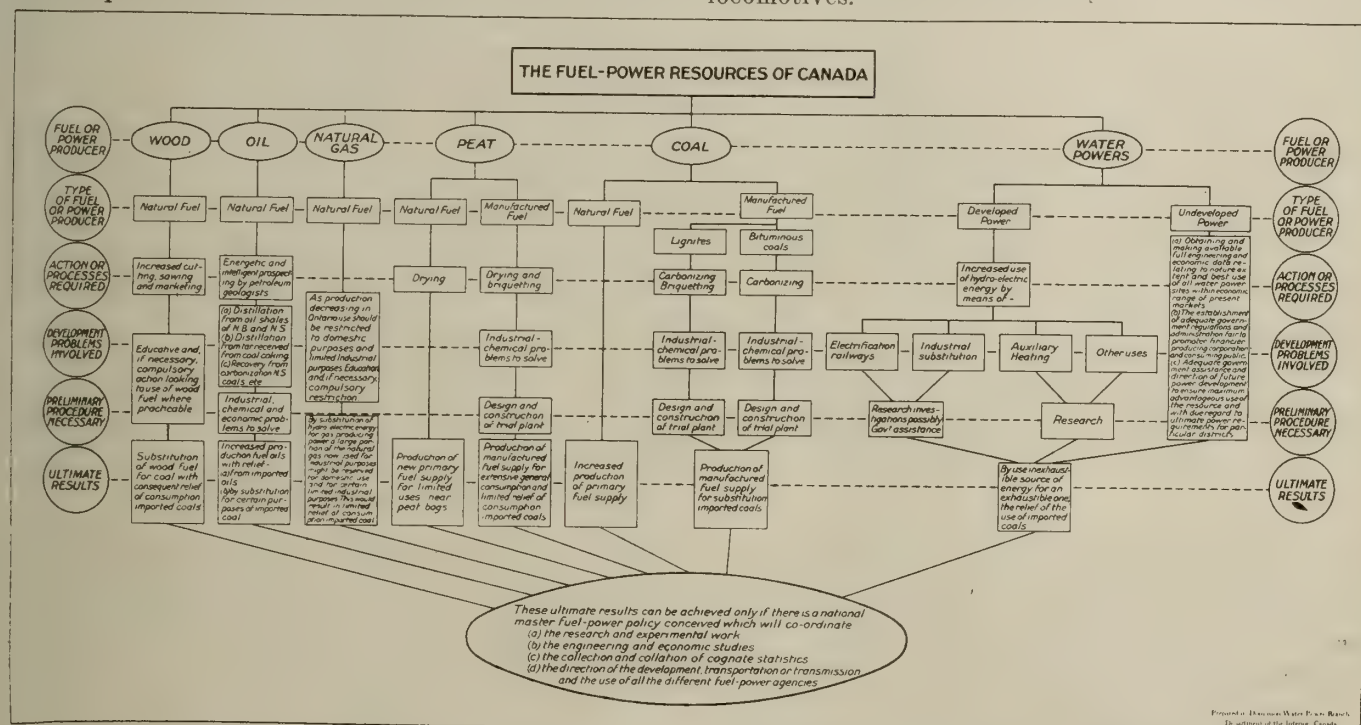

scale that all that is necessary is their proper exploitation and economic use for the country to be eventually practically independent of foreign sources of fuel. Mr. Haanel is particularly emphatic that Canada need not go abroad for fuel for household use, if her own fuel resources are properly exploited.

The problem of Canada's fuel needs outside of the "acute fuel area" offers little difficulty, owing to an abundance of both coal and water power. It is simply a matter of efficient and effective use of available resources. Within the "acute fuel area," however, the problem is pressing and prodigious. It resolves itself into two parts, first, provision for domestic or household heating consumption; second, provision for industrial requirements.

less, be seriously considered. Water power will be the main means of such substitution. The industrial fuel problem, therefore, in the "acute fuel area" becomes largely a matter of substitution of hydro power for fuel power.

Electrification of railways—especially terminals with adjacent engine divisions—would save enormous consumption of bituminous coal and relieve our transportation systems of their greatest burden.

It is estimated that something like 9,000,000 tons of coal was consumed by our railroads in the year 1917. Judging from the results obtained from the electrical operation of railroads in the United States, it would be possible to save at least two-thirds of this coal if electric locomotives were substituted for the present steam locomotives.

Substitutes for Anthracite for Domestic Needs.

The requirements for fuel for general household use are, at the present time, furnished by American anthracite; over 4,000,000 tons were used in 1916. Competent experts declare the anthracite coal fields of the United States are in measurable distance of exhaustion and that the supply will not last a hundred years. Having in mind the ever-increasing demands within their own borders for this fuel and the rapid decrease in quality as the supply becomes exhausted, responsible fuel advisers of the United States Government have seriously urged the establishment of an embargo against exportation of anthracite. We in Canada must realize that our supply of this fuel may be gradually restricted. It is, therefore, essential that we, without delay, consider what can be accomplished in the production of a suitable substitute for United States anthracite.

Substitution of Hydro Power for Coal.

The industrial requirements are now met by Canadian hydro power and United States bituminous coal. About 14,000,000 tons were consumed in 1916 for this purpose in the "acute fuel area."

Owing to the large reserves of bituminous coal in Pennsylvania, this class of fuel will probably be available to the "acute fuel area" of Canada for many years. Although not immediately necessary, the ultimate substitution of bituminous coals must nevertheless

This would be a saving of 6,000,000 tons of coal in one year, and would require about 900,000 water horse power.

Electrification of steam roads at this juncture is not advocated. Under normal conditions, however, and in certain districts, as in western Ontario, electrification will become an economic necessity in a few years.

In districts that cannot be served by water power, the location of modern, efficient, super-power stations at strategic points, with a resultant elimination, or combination, of many inefficient small stations, would cause a very large saving in the consumption of soft coal, with a concurrent increased production of power.

The substitution in industry generally of hydro power for steam fuel power, would also result in a tremendous relief. There are many plants where such an exchange would be possible now. Future manufacturing plants should be encouraged to locate where hydro power is available.

The relation between developed water power and the coal production and consumption in the various provinces is represented on Plate 2. It is interesting to note that in the "acute fuel area" there is about as much water power developed, so far as coal value is concerned, as there is coal consumed. It is portentous that the bulk of our water power production at the present time is within the "acute fuel area," and it is

SOURCE OF INFORMATION: The basis of the table is the paper by M. Arthur Sawyer, Consulting Engineer, Montreal, read before the Canadian Society of Civil Engineers. Subsequent information obtained by Mr. H. E. M. Kennel and Mr. A. M. Beale, of the Dominion Water Power Branch is incorporated. The table is not absolutely correct, but indicates a reasonable summary of the situation.

reassuring to know that our largest and most important potential water powers are located within transmission range of present congested industrial districts within the "acute fuel area."

When considered in retrospect the production of hydro power in Canada has undoubtedly been an industrial achievement and an engineering triumph worthy

of our nation. In the short space of about twenty-five years, there has been developed and put in use, nearly 1,800,000 water horse power. A tabulated statement (see Plate No. 3) of the water power development in other countries, compiled recently from all available data, shows the universal importance of this resource and indicates the splendid comparative position Canada enjoys in both potential and developed water power. The present per capita power development in Canada is larger than all other countries except Norway. It is the same with respect to our known undeveloped water power. No country enjoys to a greater degree the benefits of cheap, dependable hydro power, and no country has had these benefits more universally applied for municipal, industrial and domestic use.

Fortunate Location of Our Water Powers.

The outstanding feature of the water powers of Canada is their fortunate location with respect to existing commercial centres. Within economic transmission range of practically every important city from the Atlantic to the Pacific, except those in the Central Western Prairies there are clustered water power sites, which will meet the probable demands for hydro-power for generations. The following table, prepared by the Dominion Water Power Branch indicates, reasonably accurately, the provincial distribution of the developed and undeveloped water powers within the settled portions of the Dominion.

Province.	Power Available.	Power Developed.
Ontario	5,800,000	789,466
Quebec	6,000,000	520,000
Nova Scotia	100,000	21,412
New Brunswick	300,000	13,390
Prince Edward Island	3,000	500
Manitoba	3,500,000	76,250
Saskatchewan		100
Alberta		32,860
British Columbia	3,000,000	269,620
Yukon	100,000	12,000
Total	18,803,000	1,735,598

Pipe near Power House.

Chaudiere Falls, Chaudiere River, Quebec.

Power House, Granby Consolidated Mining, Smelting and Power Co., B.C.

To visualize the interdependence and interrelation of all the fuel-power agencies available in Canada, and to offer something as a basis for general discussion, I have prepared a chart (Plate No. 4). If the chart indicates any one thing it conclusively proves the immensity and complexity of the problems involved in effecting the co-ordinated, concomitant development and use of all our fuel-power resources. The chart shows that this can be best realized following the evolution of a national master fuel-power policy for all of Canada.

Cheap power promises to be one of this country's greatest assets in the post-bellum industrial rivalry of nations for world trade. Our great fuel reserves, supported by our water power resources, represent a sure source of cheap power, and should guarantee Canada her share in world trade, if our varied fuel-power resources are availed of to their maximum possible advantage.

Conservation in Use of Coal

In the discussion of a paper presented at the New York meeting, Feb. 1918, of the American Institute of Mining Engineers, Edwin Ludlow, of Lansford, Pa., said in part:

For the first time in our history it has become the duty of the coal operator not only to practise the conservation of his own resources, but to preach conservation in the utilization of coal, by obtaining its full heat value. Coal operators in the past have been more interested in trying to mine coal at a cost that would enable them to keep their balance on the right side of the ledger, than in studying the full extraction of their coal resources. If they had done so in the past, only in favorable situations would it have been possible to mine and sell the coal in the competitive markets at a price that would return the cost of production. With the advance of prices and the demand for coal in excess of production, which is liable to last for many years, operators can now study more intensive methods for the complete extraction of the contents of their coal seams, with the security that their additional outlay and their higher costs will still net them a fair return on their investment.

With the higher cost of coal, it has also become a strong inducement for the manufacturer to pay closer attention to the results obtained from his boiler houses. In the past, coal has been so cheap that very little attention has been paid to scientific methods of firing, and to the full utilization of the B.t.u. in the coal purchased. A large manufacturer not long ago assured me that he was very particular about the purchasing of his coal, and insisted that all coal must be up to a standard of 14,600 B.t.u. In looking over his steam results, I called his attention to the fact that his coal should show an evaporation of 11 lb. of water per pound of coal, but that he was actually obtaining only 9 lb., and that by proper firing he would make a saving of at least 20 per cent. in the quantity of coal he used.

In a large number of cases that I have had occasion to investigate, it has been found that the fireman is really the arbiter of the quality and quantity of coal that is to be used, and that his methods of utilization are usually far from scientific.

It becomes the duty of coal men, when the opportunity offers, to call the attention of their customers to the conditions in their boiler rooms and point out to

them how their consumption of coal can be decreased by more economical methods of firing and better boiler practice.

Recent development of large power plants located at the mines, for the generation of electricity and its transmission to distant places, points to the most available method for the utilization of a great deal of inferior coal now thrown away at the mines, or not now mined, that could still be economically used under proper boilers if no transportation charges were added to the cost of this fuel.

This plan has already been put in practice in the anthracite region for the utilization of the finer sizes that have heretofore been considered too small to be economically used under boilers, and approximately three to four million tons of fine coal is being thrown away each year at the anthracite mines. Briquetting permits the transformation of this fine coal into a domestic fuel equal, for many purposes, to the best grades of anthracite.

These large electric plants are now burning the finest size buckwheat, which was formerly unsaleable, and are able to obtain a 200 per cent. rating on their boilers, and are sending out electricity at 110,000 volts to a radius of 75 miles. By doubling this voltage, it is estimated by electrical engineers that electricity can be sent at a less cost than fuel can be shipped to a radius of 200 miles, which would include Philadelphia and New York. The electric power required in these cities, instead of being manufactured at these points, could be more economically manufactured at a large central station located in the anthracite field. This development would relieve a tremendous congestion on the railroads in the handling of the fuel needed for these large electric plants in the cities, and would be utilizing a grade of fuel that has heretofore been largely thrown away at the mines. The accumulation of this class of material in the anthracite region amounts to at least 25,000,000 tons, and is being added to each year at the rate of 2,000,000 to 3,000,000 tons.

In the general production of anthracite, the Pennsylvania fields have probably reached their maximum, with very little virgin territory left to be developed, and no large increase can be expected in the output of anthracite coal for the future from the Pennsylvania fields, except by the utilization of what is now being wasted.

Mr. Chas. W. Goodale, vice-president, and Mr. Bradley Stoughton, secretary of the American Institute of Mining Engineers, have been visiting the Northwest, paying an official visit to local sections of the Institute in several cities. In Montana, they attended meetings at Butte and Anaconda, and in Washington, at Spokane and Seattle; they were cordially welcomed by members in all those cities.

Mine fatalities in British Columbia for the first quarter of the present year totalled five, compared with seven in the corresponding three months in 1917, according to the quarterly statement just issued by the Chief Inspector of Mines. Two occurred in coal mines and three in metalliferous mines, compared with one in the former and six in the latter last year. The coal mine fatalities occurred, one at the Michel colliery and the other at the Coal Creek colliery, of the Crow's Nest Pass Coal Company. Two of the fatalities in the metalliferous mines occurred at the Anyox mine of the Granby Company, and the third at the Florence mine in the Ainsworth division of West Kootenay district.

Alberta Mines Can Supply all Coal Needed in Prairie Provinces

By John T. Stirling.

The amount of coal produced in Alberta during 1917 was 4,863,414 tons, exceeding that of 1916 by 214,810 tons, notwithstanding the fact that the production during the year 1917 was considerably interfered with owing to labor troubles and lack of railway facilities in certain districts.

If the mines had worked steadily throughout the year with the present labor employed and the present amount of development, the amount of coal produced would have been approximately 8,000,000 tons or more than 3,000,000 tons in excess of the amount actually produced.

The importance of this will be readily understood when it is remembered that over 3,000,000 tons of coal imported from the United States was consumed in the provinces of Manitoba, Saskatchewan and Alberta, territory which should be entirely supplied by the production from the Alberta mines. It might, therefore, be very well asked why it should be necessary to import into Western Canada at the present time over 3,000,000 tons of coal per year, particularly at a time when the operation of munition plants and other essential industries in the United States and Eastern Canada is being very seriously interfered with owing to lack of fuel. Is it not absurd that such a condition of affairs should exist or be allowed to exist?

Not only can there be more than sufficient fuel produced from the Alberta mines to supply the demands existing, or likely to exist in the prairie provinces, but in addition a sufficient amount can be produced to supply that part of the United States immediately to the south of us. It is being fully demonstrated every day that railway locomotives, steam plants, buildings and blocks of all kinds and sizes can use Alberta coal, in Alberta, Saskatchewan and Manitoba with very satisfactory results, so that there appears to be no reason why the same fuel cannot be used entirely throughout these provinces, including Winnipeg.

The statement has been made on various occasions that Alberta coal will not store. While this may be true to a certain extent regarding 25 or 30 per cent. of the output produced, it is not true of the other 70 or 75 per cent.

It is hardly reasonable to expect that while the United States is cutting down her industries to a minimum she will continue to supply fuel to Canada, more particularly Western Canada, when there is a supply in Western Canada more than sufficient to cover all demands. It might, therefore, be expected that Canada will be able to rely less and less on the coal supply from the United States.

In the first place it is not to be expected that American manufacturers will submit quietly to coal being exported to Canada while their own industries are idle for days at a time owing to lack of fuel. Up to the present time they have shared and shared alike; but already complaints are being received and it is not in the least surprising to learn that the Deputy State Fuel Administrator for New York is criticizing the actions of shippers and producers in sending coal to Canada at a time when the industries throughout that State are being considerably interfered with owing to lack of fuel required to fulfil war contracts.

Although a large surplus of coal exists in Alberta, it is necessary that some action should be taken in order to make the plan of distribution more satisfactory.

The greatest demand comes in the fall and winter months, at a time when the difficulties of operation are greatest, owing to scarcity of labor and lack of railway facilities, as the railways during those months are busy moving the crops and it is difficult to get a sufficient amount of rolling stock for the shipment of coal.

In January, 1917, 8,550 men were employed in connection with the mining industry in Alberta, while in June this number was reduced to 3,091 and again increased to 9,812 in December. The overhead charges run on just the same, thus causing a very considerable loss. No industry can be built up in this manner on a permanent basis and it remains for some authority to institute some system that will utilize this enormous force that is at present going to waste.

It has been suggested on several occasions recently that the Ontario forest reserves should be cut down for the purpose of supplying fuel, although there is an excess supply of fuel to the extent of several millions of tons in Alberta coal mines and complete facilities there for its production. It has also been suggested that Alberta coals have not been used in greater quantities in Saskatchewan and Manitoba because greater profits have led the dealers to push the United States product in preference to that of Alberta.

The development of the coal mining industry in Alberta along the lines suggested above, means that instead of the Western provinces paying Pennsylvania coal operators and transportation companies nearly \$18,000,000 for coal in the year 1916, this money would have been kept in Canada. Had the Alberta coal fields been properly developed and a market found for the product in Canada, we would have been about \$18,000,000 better off in our trade balance.

MONTHLY PRODUCTION OF COAL IN CANADA BY PROVINCES*, 1917.

The Use of Coal in Pulverized Form^{*}

By H. R. Collins.

The purpose of pulverizing coal before burning it is to make available every heat unit it contains. Machinery has been developed which will pulverize coal in one operation, delivering it to bins in front of the furnaces at an expenditure of about 17 hp.-hr., per ton, in a medium-sized plant. The cost of the operation depends upon the amount of moisture that must be expelled before pulverizing, the cost of labor, and the cost of coal delivered at the plant. At a small plant, requiring a pulverizer with a capacity of only half a ton per hour, the cost per ton pulverized will naturally be greater than at a plant requiring the largest pulverizer, with a capacity of 7 tons per hour.

The first step is to reduce large lumps to a size suitable for drying uniformly, before passing to the pulverizing mills; this is done in rolls, at a single pass. The second step is the elimination of moisture, in order to facilitate pulverizing to great fineness, while also increasing the heating effect and the temperature attainable when the coal is burned. There are other mechanical advantages in the handling of dried coal.

Driers are now manufactured which are able to eliminate moisture without distilling any of the volatile combustible matter in the coal; they are fired by hand or with pulverized fuel. The heat first surrounds the shell of the drier, being confined within a chamber where complete combustion takes place; the heated gases are then led through a duct to the discharge end of the drier and enter the inside of the shell at a temperature not exceeding 300° F. This temperature is maintained by the operator and is indicated by a pyrometer. Volatile combustible matter is not likely to be distilled until the temperature rises above 400° F.

On discharging from the drier, the coal is usually passed over a magnetic separator in order to prevent pieces of iron from going to the pulverizer. Two types are used; a magnetic pulley which automatically discharges its collection of iron, and a lifting type, from which the iron is removed by hand when convenient.

In the operation of pulverizing, the coal should preferably be reduced until 95 per cent. will pass through a 100-mesh and 70 per cent. through a 300-mesh sieve. Such a product is obviously an almost impalpable powder.

After pulverizing, the fuel is conveyed by one of several methods to the point where it is to be used. In several installations the pulverized coal is conveyed a distance of over 900 ft. Where possible, a bin should always be installed at the furnace, in order to guard against interruption of supply.

Feeders are practically indispensable for regulating the passage of the fuel from the bin to the burner. They are now made quite simple and highly efficient. They deliver the pulverized coal in definite quantities into an air current of fixed volume, where the air disseminates the pulverized fuel, surrounding every particle and putting it into condition to develop all its energy. The first to ignite are the volatile gases; these raise the temperature to the ignition point of the solid carbon, and before leaving the zone of heated air every particle has released its last heat unit. It is entirely possible to obtain temperatures ranging between 1900°

and 3500° F.; the highest temperature (3500°) I have observed was in an open-hearth, when the average temperature of the furnace itself at some time ranged from 3100° to 3200° F.

To justify the expense of erecting a special building, and installing special machinery to pulverize coal, the following advantages in its use may be enumerated:

1. Conservation of the country's fuel, by utilizing every heat unit in the coal, made possible by this method of consumption.

2. Reduction of labor for handling coal to the point of consumption, handling by the fireman, and the removal of ash and unconsumed fuel from the ashpits; practically all of this expense is avoided when fuel is burned in pulverized form. All the coal is received at one point, and thereafter it is handled entirely by automatic machinery, the human element being thereby eliminated, except for supervision, adjustment, and repairs.

3. From actual experience with many grades of coal we believe that every carbonaceous fuel in solid form, from lignites to the graphitic anthracites of Rhode Island, will yield its maximum measure of heat, if burned in a truly pulverized condition.

4. Coal in pulverized form can be injected into a furnace on a column of air, at very low velocity, thus allowing the expanding gases to liberate their heat without erosion of the refractories.

5. Pulverized fuel permits the maintenance of a constant temperature in a furnace, when the relative amounts of fuel and air have once been set, and the body of the furnace has been brought up to the desired temperature. It will continue thereafter under what is known as a test condition. Furnaces can be operated in this manner hour after hour, as shown by charts of recording pyrometers. The correct relationship between the amount of pulverized fuel and the volume of air, for any desired temperature, can be controlled automatically, after adjustment to the particular grade of coal in use, thus using a minimum of excess air. We have obtained gas analyses as high as 17 per cent. of CO₂.

Savings by the adoption of pulverized fuel in the operation of various types of furnaces have been attained as follows: heating and bushelling furnaces, 20 to 25 per cent.; puddling furnaces, 30 to 50 per cent.; open-hearth furnaces, compared with gas producers, 30 to 40 per cent.; copper reverberatory, smelting ore, 30 to 45 per cent.

In other furnaces, the consumption has been reduced to the following figures; continuous billet heating, 160 lb. of coal per ton of billets; desulphurizing iron ore in rotary kilns, 296 lb. of coal per ton of ore; drying and nodulizing iron ore in rotary kilns, on basis of 30 per cent. free moisture and 11 per cent. combined moisture 477 lb. of coal per gross ton of ore.

The above figures are from actual operations over extended periods, and confirm our contention that coal burned in true pulverized form is the only method by which every heat unit in the fuel will develop its full value.

^{*}Extracts from a paper to be read at the Colorado Meeting, American Institute of Mining Engineers, September, 1918.

PERSONAL AND GENERAL

Mr. S. S. Fowler, general manager for the New Canadian Metal Company, operating the Bluebell lead mine and concentrating mill at Riodel, on the eastern shore of Kootenay Lake, B.C., has been spending a vacation in Southern California.

Mr. Herbert Carmichael, for many years provincial assayer for British Columbia, is again in Victoria, after having been for several years engaged in investigating tungsten properties in Nevada and in other mining business in California.

Mr. E. Jacobs has gone to California, after having been for twenty-two years engaged in British Columbia, largely in supplying mining journals and other publications with information concerning the progress of mining in that province.

Mr. Geo. H. Aylard, of Victoria, B.C., general manager for the Standard Silver-Lead Mining Co., operating in the Slocan district of British Columbia, has been spending the latter part of the winter in Southern California.

Mr. J. B. Tyrrell has returned to Toronto from Oklahoma.

Mr. J. H. Stovel, resident Inspector of Mines for the Sudbury district, has resigned and has entered the employ of the E. J. Longyear Company. He is located at Bessemer, Alabama.

Mr. T. B. Williams, who for several years has been chief engineer for the Canmore Coal Company at Canmore, Alberta, has accepted the position of night foreman and engineer for the Jasper Park Collieries, at Pocahontas, Alberta.

Mr. D. C. Bard, formerly of Victoria, but now with the Alaska Corporation, Seattle, Washington, recently examined mining properties in the coast district of British Columbia, with the object of securing more ore producers to ship to Ladysmith smelter, Vancouver Island.

The Consolidated Mining and Smelting Co. is steadily increasing its output of zinc ore from its Sullivan mine in East Kootenay, B.C. The average quantity received daily at its electrolytic zinc refinery at Trail from that mine during the month of January was 185 tons; for February, it was 251 tons; for March, it was 320 tons, and for the first week of April, it was 432 tons a day.

Corp. John Thomas Garbutt, who enlisted in the 83rd Battalion, in July, 1915, died of wounds, May 19, 1916, at St. Eloi. His one brother, Fred, is in Scotland with a forestry battalion.

"LITTLE DAVID" PEDESTAL GRINDER.

A recent development of the "Little David" line of pneumatic tools, is the "Little David" Pedestal Grinder, No. 8, of the Canadian Ingersoll-Rand Company. This handy little machine is self-contained and can be readily moved. For mine work the most satisfactory location is with the sharpening equipment, so that as the drill steels are sharpened the shanks may be squared off.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

Preparing for Resumption of Placer-Mining.

As the spring season advances, preparations for resuming placer-gold mining are being made. It is expected that the supply of water for gravel-washing will be at least as large as that of most ordinary seasons, the fall of snow during the winter having been sufficient to warrant this expectation. Hydraulic mine operators have returned to Cariboo and Atlin, and in both fields piping should be in progress by the time these notes shall be printed.

Dividends Paid by B.C. Mining Companies.

Dividends paid by metalliferous mining companies operating in British Columbia for the first quarter of the year are reported to be higher in total than for the corresponding period of 1916, and this notwithstanding that the Hedley Gold Mining Co.'s dividend was less than for a number of years, having been restricted to three per cent. for the quarter and the usual bonus of two per cent. additional not paid. This gives a total for the quarter from that company of \$36,000 as compared with \$60,000, which was long the total of the customary quarterly distribution of profits. On the other hand, the Consolidated Mining and Smelting Co.'s quarterly dividend totalled \$261,936, against \$219,695 for the first quarter of 1916. The Granby Consolidated Co.'s total for the quarter was \$364,972, a similar amount to that of other quarters ever since the rate was increased to ten per cent. per annum. The result is that the first quarter of 1918 shows a dividend total of \$672,898 as compared with \$645,657 for the corresponding period of 1917, or a net increase of \$27,241.

WEST KOOTENAY.

Ainsworth.—Ore shipment figures for the first quarter of the year show that in respect of total production there has been a substantial increase in the latter part of the period as compared with that of the first month. The total quantity of ore received at Trail from mines in Ainsworth division was 3,549 tons, of which 584 tons was the proportion for January, 1,319 tons for February, and 1,646 tons for March. The increase was not general, however, but was largely the result of a resumption of production at the Consolidated Co.'s No. 1 mine, from which 2,414 tons of silver ore, or more than two-thirds of the total, was received. The Bluebell, at Riodel, across Kootenay Lake from the town of Ainsworth, is again on the shipping list, troubles from excessive water underground having been in large measure overcome. The Florence, Little Phil, Spokane-Trinket, and Tariff, all near the western shore of Kootenay Lake; the Montezuma, on the South Fork of Kaslo Creek, and the Retallack and Bell in the western part of Ainsworth mining division, were other shippers during the quarter.

Will Explore Manganese Deposit.

Much interest is felt locally relative to the prospective development of a deposit of manganese ore, situated a few miles west of Kaslo, along the Kaslo and Slocan railway, on which some Seattle, Washington, men have secured an option of purchase. They state that a ready market can be found for the ore in the United States if exportation shall be permitted by the Canadian Government. Meanwhile, no work has yet been done, owing to there having been snow on the ground, but with the advance of spring this obstacle will disappear, and exploration of the extent and character of the ore will be undertaken.

Slocan.—Ore shipments to Trail from mines in Slocan and Slocan City divisions were considerably smaller in March than in February. The monthly totals for the quarter were as follows: For January, 712 tons; for February, 1,717 tons; for March, 575 tons; total for three months, 3,004 tons. Beside this there was a quantity of zinc concentrate shipped to the United States. Further, Northwest Mining Truth, published in Spokane, Washington, early in April, published the following statements relative to Slocan mines being operated by Mr. Clarence Cunningham, of that city, and associates: "Mr. Clarence Cunningham reports conditions at Slocan properties under his control as being satisfactory. Following declination of the Trail smelter to accept shipments of ore as usual from the seven producers being operated under his direction, arrangements covering two years were made with the United States Smelting Co., Midvale, Utah, and shipments approximating 25 carloads monthly have been going forward for some time. Half of this quantity comes from the Queen Bess, while generous shipments are also derived from the Hewitt and Van-Roi, near Silverton. Hewitt concentrate contains about 62 per cent. lead and from 250 to 275 oz. of silver to the ton. Queen Bess ore runs more than 60 per cent. lead and about 90 oz. of silver to the ton. At the Sovereign, on Reco Mountain, near Sandon, a new body of clean ore has been found, while the Wonderful, on the opposite side of Sandon, is also yielding clean ore in quantity. At the Idaho and Alamo, on the mountain west of the Queen Bess, work has been continued in two places throughout the winter with excellent results.

"Briefly, every property under Mr. Cunningham's management now shows clean ore in quantity, while excellent saving is being made at the two concentrating mills on Four-mile Creek, near Silverton. It is understood that the Ruth mill, at Sandon, has been secured under lease and will be used for concentrating second-class ore from the Wonderful and Sovereign mines. If the results of development at the Idaho and Alamo come up to present expectations it is probable that the old concentrator at Alamo, on the C.P.R. Co.'s Slocan & Nakusp railway, about two miles below the mines, will be thoroughly overhauled and placed in operation next summer. The average number of men employed on the seven properties the Cunningham interests are operating is about 250."

Trail.—Ore receipts at the Consolidated Mining and Smelting Co.'s smelting works at Trail during the first quarter of the current year totalled 103,118 tons, of which 90,485 tons was ore from mines operated by the company and 12,633 tons was of custom ore. The monthly proportions of this total were as follows: For January, 27,404 tons; for February, 33,989 tons; for March, 41,725 tons. These figures serve to show the gradual progress that has been made since the settlement of strike troubles at the works last December.

More than one-half of the ore received during the period under notice was gold-copper ore from the company's mines in Rossland camp, namely the Le Roi, Centre Star-War Eagle group, and White Bear, these having together shipped to Trail 15,843 tons in January, 16,790 tons in February, and 22,340 tons in March, making a total output of 54,973 tons. Receipts from the company's Sullivan zinc-lead mine, in East Kootenay, totalled 22,927 tons, of which 22,698 tons was zinc ore and 229 tons lead ore. From the Emma mine, in Greenwood division of Boundary district, receipts to-

talled 9,383 tons of copper-gold ore, and from the No. 1 mine, in Ainsworth camp, West Kootenay, the total was 2,414 tons of silver ore. Shipments from other company mines were comparatively small, as follows: St. Eugene, East Kootenay, 281 tons of lead ore; Molly Gibson, in Nelson division, 342 tons of silver-lead ore; Lucky Thought, 129 tons, and Richmond-Eureka, 36 tons, both of silver-lead ore from Slocan division. Custom ore was in the proportion of 2,483 tons for January, 5,906 tons for February, and 4,244 tons for March.

Taking the receipts from the various districts or divisions, the quantities were as follows: From East Kootenay, 24,657 tons. From West Kootenay: Rossland, 59,057 tons; Ainsworth, 3,549 tons; Slocan, 3,004 tons; Nelson, 655 tons; Trout Lake, 108 tons, and Arrow Lake, 10 tons. The total from Boundary district was 9,413 tons; from Kamloops division, Yale district, 836 tons, and Vancouver Island, 76 tons. Mines in the State of Washington shipped to Trail only 1,753 tons during the quarter, but much lead ore would have come from that source had lead-market conditions been such as would have admitted of its being smelted at Trail. As indicating the unfavorable position in regard to lead ores, it may be pointed out that of a total in excess of 100,000 tons of British Columbia ore received during the quarter, less than 6,000 tons was silver-lead ore, while the chief metal content of more than 60,000 tons was gold, of about 25,000 tons was zinc, and of 10,000 tons was copper. These quantities are approximate, yet they serve to give a general idea of the metal contents of the ores received at Trail during the first quarter of this year.

VANCOUVER ISLAND.

Coal Mining Companies Busy on Vancouver Island.

Coal-mining continues to be especially active on Vancouver Island, with the producing mines being operated to the full extent practicable under present conditions, there still being fewer miners obtainable than could be given employment at these collieries. The Canadian Collieries (Dunsmuir) Limited, is working its larger mines in both the Comox and Extension fields, and is proceeding with the development of a small mine near South Wellington. The Western Fuel Company continues to make a large output of coal from its Nanaimo colliery, with its No. 1 and Protection Island mines being operated, and its Reserve Shaft mine, several miles south of Nanaimo, opened in recent years and now also an important producer. This company, also, is developing a property that it is planned shall add considerably to the output of coal. The Pacific Coast Coal Mines, Ltd., is making its largest production from the Morden mine, opened in recent years in a part of the South Wellington field that had not previously been mined for coal, and its outlook is favorable for an increasing production as demands shall warrant further expansion, already provided for by the installation of modern plant and machinery and the establishment of shipping docks and loading appliances equal to handling a large quantity of coal. Progress is being made with the development of the coal lands situated a few miles south of South Wellington, acquired and now being opened by the Granby Consolidated Mining, Smelting, and Power Company.

Metalliferous mining is still having attention notwithstanding that ore-smelting facilities are not at present available under conditions allowing of a satisfactory return being received should ore be shipped. The Ladysmith Smelting Corporation has made it known that whenever there shall be a sufficient supply of ore

obtainable to ensure the continuous operation of its works, it will resume smelting at Ladysmith, but for the time the smeltery is idle, there being no profit in its operation intermittently. This company is developing what is known as the Thomson-Tolmie copper property, situated on Sooke Peninsula, southwest of Victoria, and it is expected that eventually sufficient ore will have been developed to make it a producer of importance. Another copper property in the same part of the island has already had the attention of local men who have been much encouraged by results obtained from the shipment of ore in quantity—several hundred tons—to Ladysmith. It is stated that New York men have lately bonded this mine, and are having it examined with a view to doing considerable work on it if a favorable report shall be received. Shipment of ore from the Blue Grouse, near Cowichan Lake, has been made to up-country smelting works, but freight and other charges have been found too high to allow of more being shipped under the circumstances. Another mine on which work has been done is that known as the Indian Chief, on Sidney inlet, west coast of Vancouver Island, and concentrating plant has been put in at it, but little is known as to recent results, except that beside the concentrating ore there has also been found some copper ore of high grade.

THE U.S. WAR MINERALS BILL.

Washington—According to the Boston News Bureau, the outlook is propitious for early action on the U.S. war minerals bill, carrying \$50,000,000 to encourage domestic production of rare minerals needed by the government for war-making purposes.

The terms of the measure carry the power of price fixing by the President, who is authorized to place the carrying out of its regulations in the hands of the secretary of the interior. It is definitely recognized as an administrative measure, and is strongly backed by Secretary Lane. Among the large number of minerals included in the bill, many are found which will be drawn upon heavily in war requirements, thus necessitating a price-fixing provision to stabilize the markets, as well as to furnish the incentives to high production through assurance of reasonable profits. While some objections have been raised against extension of the price-fixing provision in coming legislation, it is pointed out by supporters of the measure that such definite authority is more essential in the present instance than in dealings by the government with manufactured commodities, much as virtually new industries are called for in some instances in the present bill.

The bill also carries power to increase tariff rates on any of the war minerals whose production is to be encouraged, if this should be found necessary to prevent the government from confronting a loss by coming into competition at any time with imports of the same materials from abroad. This precaution naturally contemplates a situation such as would be brought about by the declaration of peace during any period which might be covered by the government's guarantee of a minimum price.

No small consideration has been given to the question of ship tonnage in the preparation of the bill. It has been estimated that the development of iron pyrites production alone in the United States will serve to release thousands of tons of space for other requirements in war transportation. In many respects, however, increased production is aimed at in direct connection with urgent war needs.

Advice From the Fuel Controllers

Ottawa, April 19.—C. A. Magrath, Fuel Controller for Canada, to-day made the following statement:

"The new fuel regulations went into effect on the 1st of April. Provision is made therein that no consumer may be supplied with more than 70 per cent. of his estimated normal needs for the year ending 31st March, 1919. I desire to point out, however, that this provision is not in any way designed to place obstacles in the way of consumers laying in coal supplies during the summer time. It is merely intended to ensure a more even distribution of coal receipts.

"The regulations on this point are extremely elastic, and provision is made whereby the moment the consumers in any municipality have been supplied with 70 per cent. of their requirements, the Provincial Fuel Administrator may, on the advice of the local Fuel Commissioner, entirely suspend the restriction referred to or may increase the percentage that may be delivered in any way he deems desirable. My advice to consumers throughout Canada is to get their coal supplies at the earliest possible moment and in as large quantities as they are able to, consistent with any restrictions that may be in force at the time.

"It is well for the people of Canada to bear in mind that we are absolutely dependent upon the United States for the great bulk of our coal supply. The United States Fuel Administration, in placing Canada on the same basis as the states of the Union with reference to coal shipments, has displayed a spirit of fairness which all Canadian will duly appreciate. There is, however, the implied moral obligation resting on Canada to conserve her fuel supply to assist the authorities across the line to solve the common fuel problem in any practical manner that may be indicated. Dr. Garfield, the United States Fuel Administrator, has recently issued a statement in which he lays the greatest possible stress on the public placing their orders for coal at the earliest possible moment. This advice, of course, applies with at least equal force to Canada.

"Dr. Garfield, in discussing the fuel situation south of the line, points out, that it is fundamentally a transportation problem. He goes on to say that there are sufficient coal cars and locomotives available only if every car and every locomotive is used to its maximum capacity every day in the year."

Toronto, April 22.—Some unexpected and most important announcements regarding the fuel and power situation, both in Canada and the United States, were made by Sir Henry Drayton, Dominion Power Controller; Sir Adam Beck, chairman of the Hydro Power Commission, and Commissioner R. C. Harris, Associate Fuel Controller, before a gathering of business men at the City Hall yesterday afternoon. Briefly stated, they were to the effect that, owing to the tremendous demands for electrical energy and fuel in both countries, to enable manufacturers to increase the output of munitions which were urgently needed, further restrictions would in all probability have to be placed on the use of light, power and coal by non-essential industries, merchants, storekeepers and private citizens. Beyond this the people were warned that next winter they must be prepared to suffer inconvenience and some measure of discomfort during the extremely cold weather, as it would be an absolute impossibility for the United States to supply sufficient coal to meet the normal demand for industrial and domestic uses. Canada would obtain

its proportionate share of the coal mined, and it would be distributed pro rata throughout the country, but there would be a shortage. The people of Toronto and of every city and town in Ontario, would have to conserve their coal supplies and be content to keep their houses less comfortable and warm than in former winters. In fact, they even might be called upon to close up part of their houses in order to conserve heat. Further than this, they would be well advised to endeavor to secure some substitute for coal, even if the thermal values were not so great. The question of comfort could not be considered, as the supply of coal coming from the States would only suffice to prevent actual hardship and distress.

Ottawa, April 20.—At the close of the conference held here this week of coal operators, labor delegates and transportation representatives with Mr. Neale, representing the United States Fuel Administration, and Mr. C. A. Magrath, Dominion Fuel Controller, a memorandum was submitted by Mr. Magrath covering the chief developments of the conference, which lasted for a couple of days.

The memorandum contained the important statement that the United States Fuel Controller felt it his duty to inform the Canadian Fuel Controller, so that he could pass the information to the Western provinces of Canada, that the situation is as follows:—

1. That anthracite coal supplies to points in Western Canada will be very materially restricted during the present coal year.

2. Under the circumstances, it is safe to predict that no American anthracite coal will be available for shipment to points west of Winnipeg.

3. It is also proposed to restrict shipments of anthracite to Canadian lake ports during the early part of the present season.

4. That the public, both East and West, must be given to understand distinctly that conservation of coal must be practised to the utmost extent by all classes of consumers.

Mr. Magrath's memorandum said that Sir George Foster had been able to announce that the attitude of the United States Fuel Administration was that Canada would receive precisely the same treatment as the various states of the Union. The Western States had been given to understand that they must use the softer coal of the West and that the available anthracite would have to be conserved for the purpose of supplying the Eastern part of the Union and the Provinces of Ontario and Quebec.

The Western coal operators stated their ability to increase the production of bituminous coal by 1,280,000 tons and of lignite coal by 1,225,000 tons. These increases would represent the amount of coal that could have been mined during the times the mines were idle last year due to strikes and want of railway transportation. The figures would not hold good unless the same amount of labor was available as last year, and unless the railways were able to furnish transportation required.

The operators urged that dealers and the public take a large portion of their supply during the summer months, when the railways are in a position to handle it.

The memorandum of the Nova Scotia operators stated that the production of Nova Scotia mines had been estimated at 5,950,000 tons, but the production actually attained was 5,660,000 tons. The operators reported a considerable improvement in transportation facilities, and pointed out that scarcity of labor had been the main factor in the reduction of output.

House Discusses Fuel Problem

In the House of Commons on April 15th Mr. J. E. Armstrong of Lambton proposed a resolution urging that deposits of bituminous and anthracite coal in Canada, located in the extreme Eastern and Western portions of the Dominion be more thoroughly utilized, that peat and lignite deposits be developed, and that the Government make a special effort to this end. Development of Canadian coal areas, he said would materially increase production.

Turning to natural gas, Mr. Armstrong stated that the waste of this valuable product in the West was enormous. He had, he said, written to the Interior Department protesting against the waste. Natural gas, he said, was the cleanest and best of fuel, and was used extensively in the United States for the manufacture of gasoline. The Government ought to take action to conserve the gas supply of the Dominion.

Powdered coal was another product which the speaker thought could be successfully used in Canada. It has been a success in Brazil, and also in the United States.

The development of Canada's great water powers for the production of electricity was urged by Mr. Armstrong. He recommended the appointment of a Minister whose duties should consist in developing water power for light, heat and power. In the Dominion, he said, 17,000,000 horsepower was undeveloped. The peat deposits of Canada should also receive the attention of the Government.

In closing, Mr. Armstrong emphasized the seriousness of the fuel situation, and insisted that drastic measures must be enforced by the Government. At present the Dominion was absolutely dependent on the United States, and if that country should be unable to supply our demands we would find ourselves in a bad situation.

W. D. Cowan, Regina, wanted to know what the Government was going to do in the line of developing the Saskatchewan coal fields. He was pleased to hear from the previous speaker that an Order-in-Council providing for an expenditure of \$400,000 on the Saskatchewan coal fields had been passed.

In Saskatchewan, said Mr. Cowan, while these coal fields were only producing 200,000 tons a year, people were importing Pennsylvania coal. He argued that Saskatchewan was not a legitimate market for coal from Pennsylvania.

H. C. Hocken (Toronto West) spoke of the suffering in Ontario last winter owing to lack of fuel. If Western coal areas were developed, Pennsylvania coal now going to the West might be diverted to Ontario, and material improvement thus effected. Mr. Hocken urged the development of water powers with a view to the operation of railways by electricity and the saving of coal.

The Minister of Mines dealt briefly with the efforts of the Government to develop peat production in Canada. About 140,000 acres of peat bogs had been mapped out. He referred to the experiments which had been made by the Government at Alfred, Ontario, saying that \$18,000 had been spent there in experimental work. In 1910 the operations at Alfred were discontinued. A private corporation which subsequently failed, taking over the plant. Owing to the fuel shortage last year, the Government had resumed experiments at Alfred, and these were now being conducted in co-operation with Provincial Government of Ontario. In

closing, Mr. Burrell said that he would bear in mind the suggestions which had been brought out by the debate.

Hon. Arthur Meighen replied to the statements of Mr. Armstrong in respect to the escape of natural gas on Dominion lands in Alberta. Mr. Meighen denied that there was any laxity on the part of the Mining Lands Branch of the Interior Department, and indicated the steps taken to prevent any waste of natural gas. Regulations to control Dominion mining lands, Mr. Meighen said, had been in effect for the last four or five years.

W. A. Buchanan (Lethbridge) felt that Western mines could meet the needs of the Western provinces and some of the needs of Eastern Canada. He was not quite sure, however, whether it was feasible to ship Western coal to Eastern markets. He thought the question of storage might well be taken into consideration by the Government, as it would go far towards solving the problem in Alberta.

J. C. Douglas (South Cape Breton) declared that the three greatest questions of the day were those of continued reinforcements for the troops in France, increased food supplies and increased coal production. He said that if the Fuel Controller was appointed mainly with a view to increasing production in Canada, and not to borrow coal from the United States, then he had been unsuccessful in his work. Since the appointment of Mr. Magrath in July, last, there had been a decrease of 600,000 tons in the production of coal in Eastern Canada.

To remedy the situation, he proposed that a reduction in the overhead charges of collieries should be effected, underpaid employes should receive increased wages, mining machinery in Nova Scotia should be improved, and companies should be made to spend excess profits in improving conditions at the mines generally. He also urged the appointment of an energetic man as a "speeder-up," the appointee to be given wide powers.

Dr. Clark (Red Deer) advocated the lifting of restrictions on the entry of mining implements to this country, declaring that only a nominal duty on such tools had existed in Argentina for a great many years. He urged the removal of the duty, but cautioned the Government not to give money away where the tariff had failed.

Alex. McGregor, Pictou, suggested that the Dominion Government should co-operate with the Provincial Government of Nova Scotia and take over the mines

of the Acadian Coal Company, operating them in such a way as to benefit the public. He did not approve the way these mines were being operated by the company.

Dr. Edwards argued that Dr. Michael Clark's assumption that the removal of the duty from coal would tend to solve the fuel problem was incorrect. The kind of coal which was used for domestic purposes and to heat houses was anthracite coal, on which there was no duty. He maintained that the trouble last year was due largely to a shortage of cars and inclement weather, which made it impossible to move the fuel.

Sir George Foster devoted the major portion of his remarks to a vindication of the Fuel Controller and an explanation of what his duties actually are. He said that the Government, in making the appointment, did not have in view the enhancing of coal production in Canada, so much as making it definitely sure that the allotment of 16,000,000 tons of coal from the United States should be obtained and equitably distributed at a fair price in Canada. He maintained that Mr. Magrath had successfully carried out his part of the programme, with the help of the United States authorities, who had been eminently fair and sympathetic in their dealings with him.

"His duty was to get the coal to Canada, but not to transport it after it had been brought across the border. The bad situation last winter, in connection with the transportation, was responsible for a great deal of the suffering throughout the country. Some people fear that we shall suffer privations again this year. If things go on ordinarily well and the transportation difficulties are not so great as last year, we shall get out allotment of 16,000,000 tons as usual."

With regard to the Western lignite coal, Sir George stated that the Government, in co-operation with the Provincial Governments of Manitoba and Saskatchewan, proposed to establish one or two units for making briquettes near Estevan. If this experiment proved a success, the Government could then choose whether it would continue the manufacture of briquettes for public consumption or leave this to private enterprise. A start on the installation of the Estevan plant would, said the Minister, be made at once, but it would be a year before manufacture of briquettes could be started. Briquettes could be manufactured at a cost of between six and seven dollars per ton and the supply of low-grade lignite coal in the West was practically inexhaustible.

ROTARY MINE CARS

WILL DUMP EITHER END OR EITHER SIDE

We make these cars to order only, and to suit the customer.

We make and list two standard types, with a choice of eight sizes and shapes in each type.

We also make any other style to customer's specifications.

Prices reasonable; Delivery good.

Our general catalogue shows many other varieties of mine cars, end dump, side dump, or rotary to dump either way. Let us send you a copy.

We also make Mine Hoists, steam, electric, or belt drive; Buckets, Skips, Mine Cages, etc.

Conserve Steel and Iron -Cut Out the Scrap Pile

Prest-O-Lite PROCESS

MILLIONS of dollars worth of damaged or worn metal parts, castings and tools lie rusting in the scrap-piles of Canadian railroads, factories, mines, foundries, repair shops, etc.

By oxy-acetylene welding, much of this enormous waste can be eliminated, and losses due to breakdowns—resulting in “tie-ups” of operating equipment—can be greatly reduced.

The Prest-O-Lite Process is ideal for all classes of metal repair work. It handles repairs quickly and efficiently—often right on the spot—makes the broken or worn part strong as new—saves the time which would be wasted waiting for replacements—avoids the “scrapping” of valuable metal parts.

The welding outfit is portable—available at all times for outside work, as well as for shop use.

In the manufacture of war munitions, ships, railway supplies, boilers, metal furniture, implements and tools, this same process makes possible many striking economies—gives neater, stronger joints at less cost.

No matter what other welding method you now use, a Prest-O-Lite outfit put to work in your shops will speedily pay you profits. Write for special literature and data—now.

Address Dept. C-108.

"USED EQUIPMENT DEPARTMENT"

WE HAVE FOR SALE. Let us quote you on the following Equipment :

Mining-Locomotives

1—7 ton 42" gauge 250 V.D.C., Type R, two motor Morgan-Gardner complete.
1—3 ton 24" gauge, Jeffery, 500 volt, used but in splendid condition.
1—3 ton 36" gauge, Jeffery, 500 volt, new.
1—3 ton 36" gauge, Jeffery, 250 volt, used, but in splendid operating condition
2—Westinghouse, 5 ton trolley type, 27" gauge new.
2—Gen. Electric, 7 ton, trolley type, 36" gauge, new.

1—10 ton Morgan-Gardner, 36" gauge, 500 volts.
1—10 ton Morgan-Gardner, 36" gauge, 250 volts.
4—Gen. Electric, 5 ton, 30" gauge, storage battery type, used, but in good condition.
2—G. E., 4 ton, 24" gauge Storage Battery Locomotives.

Pumps---Compressors and Gas Engine

1—200 h.p. Worthington 2 stage, 12 in. turbine pumps, rated capacity 4000 G.P.M. at 60 lbs. pressure, direct connected to one 100 h.p., 3 phase, 60 cycle, 440 volt, 575 R.P.M. Westinghouse induction motor, complete with auto starter and no voltage release.

1—1160 ft. Sullivan two-stage belt driven air compressor, complete.
1—1586 ft. Sullivan two-stage belt driven air compressor, complete.
1—50 h.p. Foss Gas Engine, speed 200 R.P.M., one cylinder, flywheel 4 ft. x 12 in., used only three weeks.

Transformers

Railway, Light and Power Equipment

QUALITY AND SERVICE

Let us quote you on the following Equipment and Supplies:

WE REPRESENT

Bates Expanded Steel Truss Company
CHICAGO, ILL.

Steel Poles for Railway, Light and Power Purposes. Outdoor Type Substations

Catskill Foundry & Machine Works
CATSKILL, N.Y.
Steel Gears and Pinions

Columbia Machine Works & Malleable Iron Co.
BROOKLYN, N.Y.

CAR EQUIPMENT

Armature and axle bearings
Armature and field coils
Bearings (bronze and iron)
Brush-holders and brush-holder springs
Brake, door and other handles
Brake forgings, riggings, etc.
Car trimmings
Commutators
Controller handles
Forgings of all kinds
Gear cases (steel or malleable iron)
Grid resistors
Third-rail shoe beams and accessories
Trolley poles (steel) and wheels

TOOLS

Armature and axle straighteners
Armature shaft straighteners
Armature buggies and stands
Babbitting molds
Banding and heading machines
Car hoists
Car replacers
Coil taping machines for armature leads
Coil-winding machines
Pinion pullers
Pit jacks
Signal or target switches
Tension stands

Special Shop Working Tools

Laclede Steel Company
ST. LOUIS, Mo.

"Electroheat" Axle and Armature Shafts of all types and sizes. "Electroheat" Annealed side rods, main rods, crank pins, piston rods. All kinds of "Electroheat" Forgings, etc.

Morgan Crucible Company
NEW YORK
Carbon Brushes

Railway Track Work Company
PHILADELPHIA
The Reciprocating Track-Grinder

The Trolley Supply Company
CANTON, OHIO

Trolley Retrievers, Catchers, Bases, Headlights and Electric Railway Supplies

Westinghouse Electric and Mfg. Company
PITTSBURGH, Pa.

Trolley and Catenary Construction Material

We also handle electric passenger, freight and express cars and locomotives of all types and descriptions. Keep this list before you whenever you are in the market for equipment and supplies. All engineering service without obligation. List will be continued in next issue.

ONTARIO

A Suggestion to Mine Operators

We are informed by Mr. Reginald E. Hore, editor of this Journal that last year many mine operators gave considerable encouragement to their employees to cultivate land, and thereby increase food production.

This most excellent work is highly appreciated by the Organization of Resources Committee, and we trust that it will be continued this year.

We also wish to suggest to mine operators, who have not yet attempted work of this kind among their employees, that they should, as a matter of good citizenship and national expediency, place at the disposal of their employees any land which they are not using and which may be suited to the cultivation of vegetables.

By intelligent effort in the cultivation of a piece of land the average citizen can cultivate enough vegetables to support himself and family through the winter. And remember, if food restrictions are in force next winter a supply of vegetables in one's cellar will be very useful.

It is suggested that the operators might arrange to have the land ploughed and secure a supply of seed or plants as a stimulus to their worker's endeavours.

We will gladly send to any mine operator a supply of booklets for distribution among employees, which will give them practical, easily understood information on vegetable growing; and we shall welcome a request for a quantity of these booklets as evidence of any mine owner's intention and desire to co-operate.

State how many booklets you require and address your letter to:

Organization of Resources Committee

Arrows Show
Electrical Equipment

Electric Power for Mining Operations is Safe, Convenient and Economical

The engineering problems solved in putting electric power to work in these and other industries are many and intricate. Production of electrical equipment suited to this work and in quantities required is an important part of this company's service to Canadian industries.

Any problem involving the use of power can be simplified by the application of electricity. The Canadian General Electric Company is well equipped to lend valuable assistance in working out such problems and is glad to co-operate with miners and electrical and mining engineers in every possible way.

CANADIAN GENERAL ELECTRIC COMPANY
LIMITED

PROVINCE OF ONTARIO

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Preliminary returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$71,060,942, of which the metallic production was \$56,845,788.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

For list of publications, illustrated reports, geological maps and mining laws, apply to

G. H. FERGUSON,

MINISTER OF LANDS, FORESTS AND MINES,

Toronto, Canada

Lincoln Arc Welders on the Rock Island

23 Lincoln Arc Welders are in service at the different shops of the Rock Island.

These Welders are mounted on a four-wheel truck, and can be taken any place in the shop and plugged in on any power socket where a five horse-power motor would operate.

The Lincoln Arc Welder can always be taken to the place where the locomotive is standing and welding work can go on at the same time with other repairs. Instead of moving a heavy locomotive to a special welding-station, the light truck can be taken anywhere, even for a few minutes' welding work.

In addition to this advantage, the welders use the regular current distributing system in the shop, and no special low tension wire is necessary. This saves a great expense. Examination of the Lincoln Portable Welder will show that it is the most simple in construction and operation of any arc welding apparatus manufactured, still it will do everything that any outfit will do and will perform the work at lower cost.

This statement we proved in your own shop. Write for Our Engineer.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

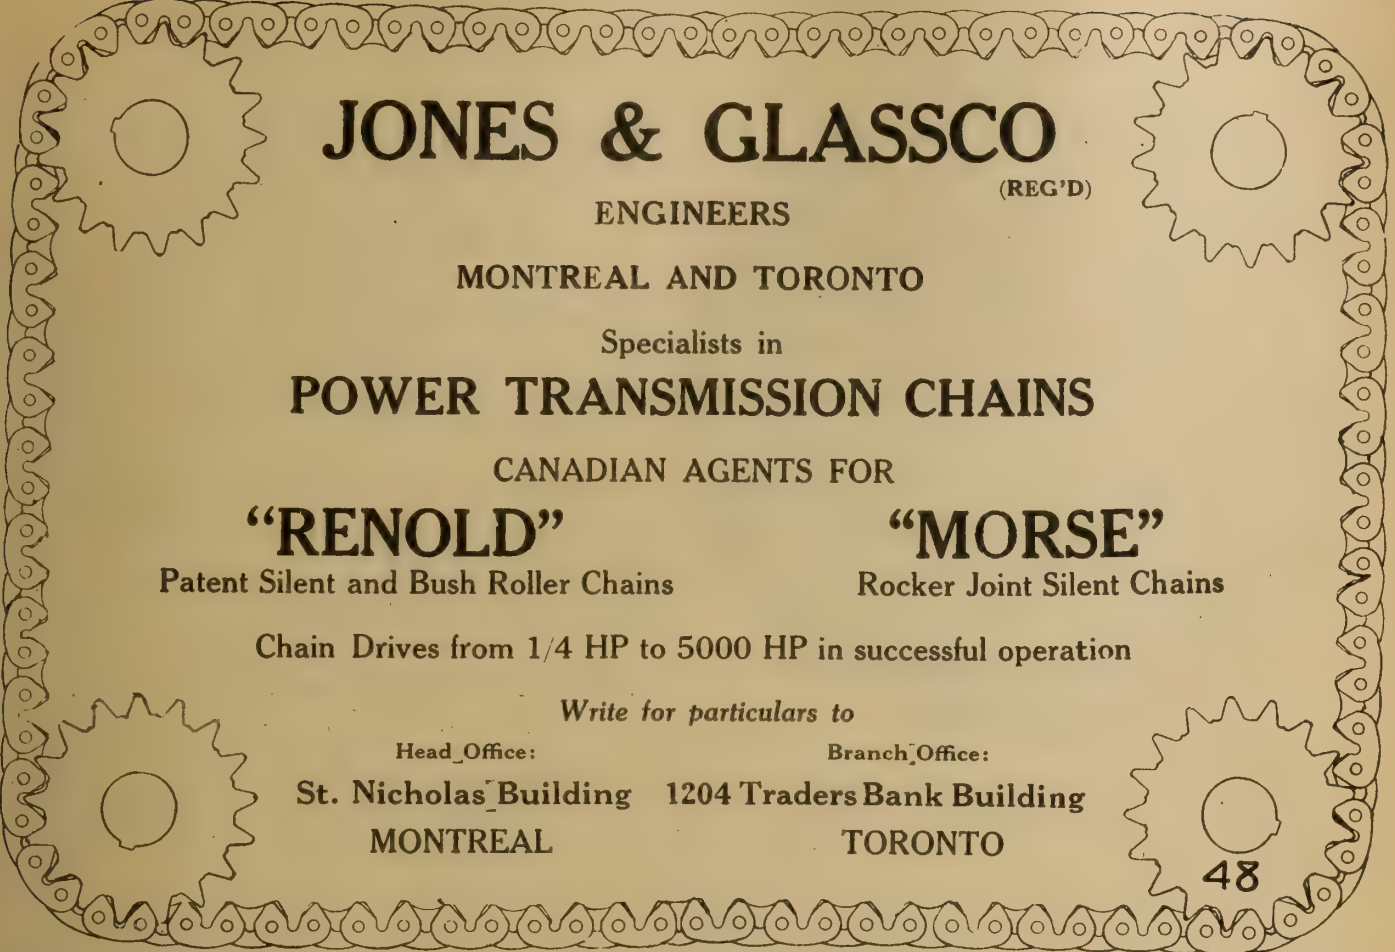

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,

Per C. F. BUSS, Superintendent.

Hardy Patent Pick Handles

We make a specialty of
these handles.

And are the only manu-
facturers in Canada.

Handles of all kinds for Coal Mining.

Write for prices.

St. Marys Wood Specialty Co., Ltd.

St. Marys, Ont.

Copper Properties Wanted

A corporation with sound financial backing is desirous of making examinations of copper properties either fully or partly developed with a view to purchase. Address Box B-3, c/o Doremus & Co., Advertising Agents, 44 Broad St., New York.

WANTED—Position as superintendent by a thoroughly practical man of experience, both in the northern countries and tropics. Would take charge of exploitation work. Can furnish diamond drilling outfit, also power drills and complete hoisting plant.—Address: 92 Algoma Street, Port Arthur, Ont.

FELDSPAR PROPERTY FOR SALE.

We believe we have the largest deposit of high grade Feldspar yet discovered in Canada. Not far from rail and water communication. For description, location, assays and price, etc., write to C. A. Phillips, Box 346, Parry Sound, Ontario, Canada.

TORONTO

No. 10

THE B. GREENING WIRE CO., LIMITED
HAMILTON, CANADA

Balance!

The balance of the reciprocating masses and movements in the horizontal and vertical members of

Sullivan Angle Compound Air Compressors

is so perfect that a coin will stand on edge on the machine, when running at full speed, without the foundation bolt nuts.

This balance and smoothness of operation saves for useful work power lost in other types of compressors in overcoming vibration and friction. It saves foundation cost, permits lighter construction, and smaller floor space, and enables safe operation at high speeds.

Single Angle Compound Compressors are built in capacities from 400 cu. ft. to 1100—Twin units from 900 to 2600 cu. ft.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

The "Pre-2" Direct Connected Air Compressor

A Great Combination

DIRECT ELECTRIC DRIVE--the use of self-starting synchronous motors gives you electric power at the very cheapest rate.

INGERSOLL-ROGLER AIR VALVES -- no valve gear, positive action, nothing to get out of order--silent, quick, efficient action.

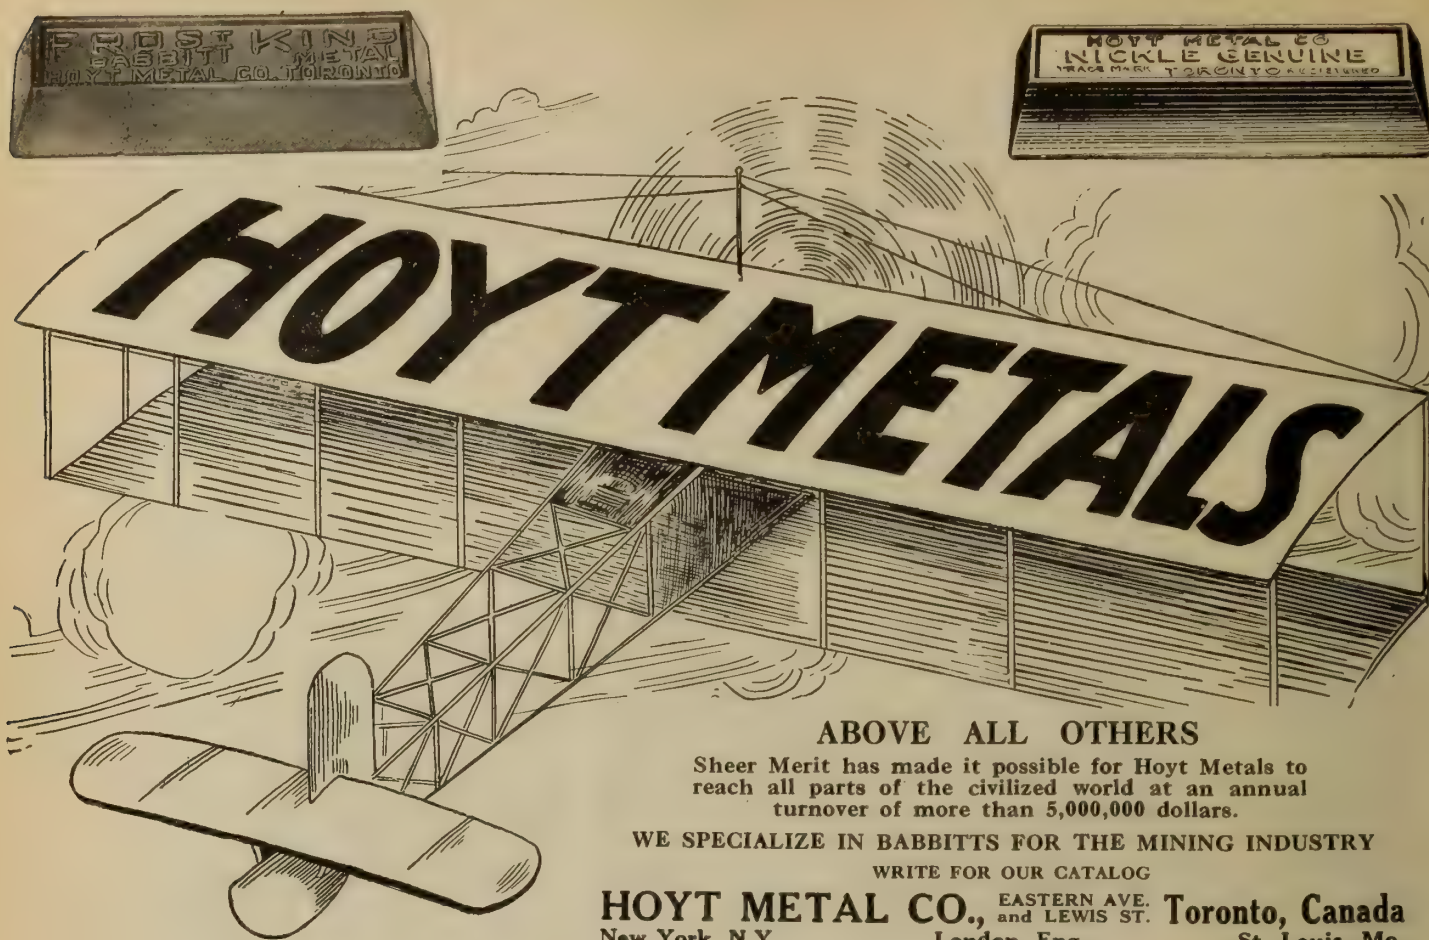

Let us send you BULLETIN 3026: it shows you the other notable features of these compressors, and how they spell E-C-O-N-O-M-Y.

Conserve Your Man Power and Reduce Operating Expenses

The first is absolutely necessary from a patriotic standpoint—the second is the first thought of every successful business man. Both can be accomplished when you install the “New Cleveland” Stoper in your mine. It has speed, with staying power and efficiency, double that of any other drill on the market. It has lower operating expenses, because of its low air consumption, and its economy in repairs, through its dropped forged parts of simple design which are practically unbreakable.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

TRANSPORTATION BUILDING
MONTREAL

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

Stage Crushing vs. "One Easy Step"

MARCY MILL

CRUSHING
"ONE
EASY
STEP"

The Marcy Mill carries a heavy flexible mass of graded balls, together with a small amount of ore. Its action on the ore when in closed circuit with a mechanical classifier is that of graded crushing.

In the Marcy Mill fine crushing is done by abrasion and rolling action. Whenever you crush a piece of ore many sizes are produced. The removal of the finished product as fast as made increases the efficiency of the mill. [Marcy Mills alone will do this.

The fineness of the product is determined by the mechanical classifier. While Marcy Mills are highly efficient while operating in the tandem arrangement, there are many disadvantages in this method of operation. If you are interested, we can advise you why these disadvantages exist.

We recommend the Marcy Mill and the "One Easy Step" System for three-inch feed and smaller sizes making a product to pass 8, 20, 40, 80 or 100 mesh.

Write and we will give you conservative engineering data pertaining to your problem.

When Ordering Food
Supplies Include

KLIM
IN POWDER FORM

IT FILLS YOUR MILK NEEDS

Klim is pure Ontario milk pasteurized separated and reduced to powder form.

It contains nothing but pure milk-solids—casein, albumen, milk sugar, and milk salts. When dissolved in water it has the natural appearance and taste of fresh liquid milk. The 10 pound tin of Klim makes forty quarts of liquid.

Klim bulks smaller and weighs less than any other form of milk and saves 70% freight charges, because it weighs that much less. It remains good indefinitely. Weather conditions do not affect it. It is the satisfactory, economical milk for camp and private home use.

Coal mine operators are beginning to realize that coal has been selling too cheaply. This is a good thing for both mining company shareholders and employees, for so long as the product sells at prices that have ruled during the last decade there will be very little profit in the business and great difficulty in increasing wages of employees. If, in the future, coal is sold at a reasonable price, the wages of coal miners will undoubtedly be higher. At the same time shareholders will have some chance of obtaining a fair return on the money invested.

Nova Scotia is consuming much larger quantities of coal than usual and producing less. Consequently there is little coal available for Quebec; but there seems to be difficulty in obtaining transportation for what can be shipped.

THE GOLD MINING INDUSTRY AND THE WAR.

In this issue we publish an article on gold by Mr. Hennen Jennings, consulting engineer of the U. S. Bureau of Mines. Everyone employed in the gold-mining industry should read Mr. Jennings' article, for it will help them to realize that, in adding to our gold supply, they are doing very necessary work during the war.

It has been argued by some that the mining of precious metals during the war is an unnecessary waste of labor. Such a distinguished economist as Prof. Adam Shortt, in the first year of the war, made a good argument in favor of restriction of gold output. Then, when the United States entered the war, there was some discussion of this subject in the technical press. The arguments are well replied to by Mr. Jennings, an acknowledged authority on gold, who points out that gold will continue as the standard only if it is kept alive by continual new supplies. That it is to the interest of the Allies to maintain the gold standard is obvious, when we remember that nine-tenths of the production is controlled by the Allies. Increased gold production during the war will benefit the Allied countries, and it would be folly to devitalize a standard of exchange that is so favorable to us.

Unfortunately, it is true that a period of high prices is not the most favorable time to mine gold. While the product sells at the same price as in periods of low prices, the cost of production is very much higher. Owners of gold deposits have had good reason to consider whether they would not profit more by closing down until conditions become normal again. If they had only themselves to consider, it is not improbable that many directors would be in favor of closing down during the war. Some of them would doubtless believe that in doing so they were not only conserving their ore until they could mine it more cheaply, but that they were actually helping their country by releasing labor. They probably have not seriously considered what it would mean if the Allied countries were to severely decrease their output of gold and so discredit the gold standard. We can scarcely expect that, as individuals, they would worry very much about it. They doubtless expect, and they have a right to expect, Government action in such matters.

Gold mine operators are, of course, finding it impossible to make normal profits during the war. If it were realized that gold production at this time is especially necessary, possibly some encouragement might be given the industry. Is it to be expected that a great effort will be made to increase production of gold in the face of increased costs, if there is no proper recognition of the fact that such increase benefits the country more than it does the mine owners?

Encouragement to gold mining companies at this time should not be withheld. Our Governments would do well to consider whether it is good policy to tax an industry of this nature during the war on the same basis as industries which are benefited by the war. Those who are making large profits from the industry expect to be taxed, but it should be recognized that there are no war profits in gold mining.

THE SHORTAGE OF LABOR IN NOVA SCOTIA MINES.

Last July, coal mine operators of Nova Scotia submitted to the Fuel Controllers an estimate of 5,950,000 tons as the probable output of Nova Scotia coal mines in 1917. The production was 290,000 tons less than estimated. Increasing scarcity of labor and two disastrous mine explosions were the chief reasons for the failure to make the estimated output.

The coal operators now estimate that with their present supply of labor the mines should produce 5,430,000 tons in 1918 or 230,000 tons less than the unsatisfactory total of 1917. As, however, there will be further calls on the younger men as a result of the Amendments to the Military Service Act, it is probable that the labor supply will be even worse than at present and that consequently the production will be even less than estimated.

According to the operators, there is little reason to hope for many additions to the forces in the mines as there is no known source in Canada from which they might be obtained. Since this is the case, there seems to be especial need of increasing the tonnage per man employed. The operators suggest that an appeal should be made to the workmen to do more than the customary amount of work because of the pressing national necessity. They have suggested to the government that Mr. J. C. Watters should visit the mining centres and take up this matter with the miners as being one of great national importance.

It is reasonable to expect that an appeal to the workmen would have a good effect. The coal miners have, as a class, proven very ready to fight the nation's battles at the front and those at home may be depended on to do their part if the need for extra exertion is understood by them. There must, of course, be adequate compensation for extra work. It is up to the operators to do everything possible to increase the number of tons per man without increasing the consumption of human energy. It is also obvious that if coal mining is so important as we believe it to be, coal miners should receive better wages than they have in the past.

It has been announced that Canada will receive the same treatment from the Fuel Administrator of the United States as though Canada were part of the United States. In that case there will be no shipping of coal to parts of the country which should and can get their supply locally.

GEOLOGICAL REPORT ON METACHEWAN GOLD AREA.

There will soon be published by the Ontario Bureau of Mines a report, by A. G. Burrows, on the Metachewan area, in which important gold discoveries were made last year. Four townships are covered by the report. The Otisse claim in Powell township is to be thoroughly tested this summer and the surrounding country will likely be the scene of considerable activity. Mr. Burrows' map and report will, therefore, be of immediate value to prospectors.

Why Coal is Imported Into Western Canada

In the discussions of a paper at the annual meeting of the Canadian Mining Institute, Mr. G. G. S. Lindsay said, in part:

"Why is this large quantity of bituminous coal imported from the United States? Because it pays the railways to so direct it. The empty car movement from the head of the Great Lakes is westward. The full car movement to the head of the Great Lakes is eastward, and everybody who has had any experience in practical mining and in the handling of coal in Western Canada knows that the difficulties in connection with the marketing problem are those of transportation, namely, adverse freights and shortage of cars. In other words, the question is one of replacement. What produce or goods can the railways carry westward in the place of the imported bituminous coal? I would urge on those who seem to have this problem so much at heart that they should consider it from that standpoint. There are a very great many kinds of coal in the Canadian West. They range from inferior lignite in Saskatchewan to the very highest grade of bituminous coal obtainable in America, and the grade improves steadily as you approach the summit of the Rocky Mountains. In Saskatchewan, the coal is of the poorest grade, while that mined at the summit of the Rocky Mountains is the best, and will compare favorably with the very best coal that obtains in the bituminous field of this Continent. These coals will stand transportation, and they make very little slack; what slack they do make can very profitably be converted into coke, and there is a market for every ton of such coke. Why, then, do we bring coal to the prairie provinces from the United States, when in our own country we have a better coal that we might deliver to that Canadian market at a lesser cost? The freight rate from the summit of the Rocky Mountains to Winnipeg is \$4.50, and with the price of coal at \$3, it could be laid down in Winnipeg for \$7.50; and at intervening Saskatchewan and Manitoba points at less prices, depending on freight rates, and this, moreover, is a better coal than can be obtained from the United States for the same money. Why, then, is not that market open to Canadian producers? The answer is, because it has not suited the railways to favor it for the reason already mentioned that the empty car movement is westward and the full car movement is eastward. As to the proposal to briquette the inferior lignite coal of Saskatchewan to replace what represents a comparatively small proportion of imported anthracite, this expedient, it seems to me, is needless if, as I have suggested, high-class bituminous coals from Western Canada are made available in the market referred to at a lesser price than either anthracite or the proposed manufactured fuel.

Dr. W. G. Miller, Provincial Geologist of Ontario, has been asked to represent Canada on the advisory board of the Imperial Mineral Resources Bureau.

TUNGSTEN ORE FROM CARIBOO DISTRICT, B.C.

Mr. J. A. Macpherson, of the Cariboo Chisholm-Creek Mining Co., reports that he is operating, in a small way, scheelite deposits in the Cariboo district. The ore will be hand picked. A specimen of the ore may be seen at the office of the Canadian Mining Journal, Toronto.

The Gold Industry and Gold Standard

By Hennen Jennings.*

Gold attracted the attention of primitive man by its color, lustre and indestructibility. The earliest mining and metallurgical operations of which traces remain were those in Egypt that dealt with the ores of gold. From pictorial rock carvings in upper Egypt, as also from Egyptian hieroglyphics, it is found that the search, desire and use of gold extended back some 3,000 to 4,000 years before the Christian era.

Gold the Trading Counter.

Starting with use as an ornament, gold soon became the trading counter and has been an emblem of value to the human race as far back as history extends. Appreciation of the value of gold has been maintained through the centuries by the difficulties connected with obtaining the metal.

With early primitive methods, only the gold most abundant and easily worked and visible was first sought and this was found principally in alluvial deposits, but as knowledge, mechanical skill and tools and appliances were developed by the human race gold mining was extended to more difficult alluvial, vein, and lode deposits.

Gold, when it became the counter of trade and a measure of possession, was the most eagerly sought of all possessions, and thus it became the pioneer and stimulant in mining, metallurgy and chemistry. The search for this precious metal became so intense that the alchemists sought its transmutation from other metals, which, though they failed to accomplish, won them other knowledge and gave birth to chemistry.

The trading value of gold has been stabilized by history in that no superabundance was ever obtainable and it has always been necessary to expend labor and intelligence to an extent largely commensurate to the bartering value of the gold obtained.

Accurate records do not exist of the actual outputs of gold in early times, but certainly they must have been small from a modern standpoint. Great outputs of gold, as of all other minerals, are a matter of recent times.

It has been officially estimated that the world production of gold since the discovery of America, in 1492, to the end of 1916, a period of 424 years, was \$16,601,641,319. The output since 1894, a period of 23 years, was approximately \$8,500,000,000, or slightly more than 50 per cent. of the total amount mined in 424 years. The average yearly production up to 1894 was \$19,107,644, while, since 1894 to date it has averaged \$369,565,217 per year.

The available gold on hand as gold reserve in 1894 has been estimated at \$3,965,900,000. The loss of gold and its absorption in the arts and manufacture of jewelry accounts for the differences between the amount produced and the amount on hand.

The amount of gold used in the arts has increased since 1894, and of late years it has been between \$50,000,000 and \$100,000,000 a year. Estimating the consumption and loss of gold since 1894 at \$2,000,000,000 the amount of gold at present on hand as gold reserve may be roughly estimated at \$10,500,000,000.

The concentration and portability of this wealth can be appreciated by converting it into tons weight, for the total tonnage of the entire gold reserve of the world

does not amount to over 17,000 tons and it could be easily transported around the world in one of the largest steamships.

Gold, as also silver, has advantages as money counters owing to large value in small volume, ease of transportation, divisibility without loss, beauty, brilliant lustre, great durability, ease with which they can be guarded, and the difficulty of counterfeiting.

The province of the various mints of the world is to give guarantee of the weights and fineness of the gold they coin. The United States dollar contains 23.22 grains of gold and 2.58 grains of alloy, making a total weight of 25.8 grains, or 1.677 grammes, and its fineness is 900. Gold coins of all nations, under normal conditions, are exchangeable on the basis of their fine gold content.

A broad outlook on modern mining and a study of the output curves of metals since the discovery of gold in this country, in 1849; Australia, 1851; and Transvaal, 1886—indicates that big mining is surprisingly modern and that great outputs of other minerals have been pioneered by gold. Until the last few years, gold outputs have shown a parallelism with those of coal, iron and copper; with the growth of railways and the deposits in our banks. It would seem that the outputs of coal during the last 18 or 20 years; iron, 15 years; copper, 13; and petroleum, 11—were greater in aggregate than the output of these minerals for all previous history.

The mineral outputs of modern times have been possible only by the advances made in invention, engineering, chemistry and business organization. Even so, it would now appear that the gold output of the world has about reached its zenith, and is giving indications of future decline, as shown by the returns for the past ten years, as under:

1908, \$442,476,900	1913, \$459,941,100
1909, 454,059,100	1914, 455,705,000
1910, 455,239,100	1915, 468,724,918
1911, 461,939,700	1916, 457,006,045
1912, 466,136,100	1917, 430,000,000 (est.)

The extreme variation of outputs during this period is given in percentages for the pre-war year 1913, and drop of 6 per cent. is seen from the previous year.

The gold production table appended gives the gold returns from all countries of the world from 1912 to 1916, inclusive, with relative percentages for the pre-war year 1913.

The table shows that gold has been mined in about 60 different countries, and in all the continents of the world. It has been found in the oldest rocks and thus in almost all subsequent geological formations. Traces of gold have been proven to exist in sea water, so the distribution of gold is most widely spread, but never in great quantity compared to other metals. Exceptional occurrence and favorable natural and commercial conditions are required for its profitable extraction.

The Gold Producing Countries.

The relative production of gold from all countries is given in percentages in the pre-war year 1913, and on a war basis they can be classified as, Allies, Central Powers, and Neutrals, with percentages as follows: Allies, 91.3 per cent.; Central Powers, .6 per cent.; Neutrals, 8.1 per cent. Of the Allies, it is seen that Great

*Consulting Engineer of the United States Bureau of Mines.

WORLD'S PRODUCTION OF GOLD, 1912 TO 1916, INCLUSIVE.

NOTE.—The percentages given are based on the 1913 production with normal mining conditions, when the Allies produced 91.3 per cent.; the Central Powers .6 per cent., and the Neutral countries 8.1 per cent.

Britain, with her colonies and dependencies, produced 62.6 per cent.; United States, 19.3 per cent.; and Russia, 5.8 per cent.

The main gold producers of the world rank in order thus: Transvaal, United States, Australasia, Russia, Canada, and Rhodesia.

Australasia's gold output from 1851 to 1903 amounted to approximately \$2,060,000,000. The output in 1903 was about \$87,000,000 and since then production has decreased gradually until in 1916 it amounted to only about \$39,000,000, or 45 per cent. of the production in 1903. There is at present no indication of any large increase of output in the future.

The Canadian gold output was very small in 1891, but mounted rapidly until 1900, when the Yukon placer workings seemed to have reached their maximum; in that year the Canadian fields produced \$28,000,000. Since 1900 there has been a fluctuating downward tendency. The years 1915 and 1916, however, show some increase; the production for 1915 being \$18,977,901

and that for 1916, \$19,234,976. The war conditions are unfavorable for exploitation or search for new discovery. The extent of territory and natural conditions are such, however, as to give hope of future greater outputs.

Russia's gold statistics are open to doubt. It would appear that gold has been worked in the Ural district since 1820 and that in the last 12 or 13 years outputs have varied from \$35,000,000 to \$22,000,000 a year. Some engineers express the belief that Siberia has greater possibilities for future discovery and exploitation of gold, as also of other metals, than all other fields in the world. At present, in view of war and industrial conditions, the prospect of large outputs of gold in the immediate future is uncertain.

Of the South American and Central American fields, Mexico is the most important. The revival of gold mining commenced with a very small output in 1890 and the maximum production was reached in 1911 with an output of \$29,200,000. Owing to the revolution in that

country the output has dropped to \$7,690,707 in 1916, which was a million dollars increase over 1915. When the country is in better political and economical condition there is good ground for hoping for increased returns.

In other sections of Central and South America the outputs have not been large, but there yet remain large stretches of unexploited territory and abandoned properties which may be found profitable to work.

Gold Mining in the United States.

The total production of gold in the United States has been given by the Director of the Mint, as under:

From 1792 to 1847	\$ 24,537,000
From 1848 to 1872	1,204,750,000
From 1873 to 1916	2,599,670,200

Total \$3,828,957,200

Official Statistics Showing Annual Tonnage Milled, Value of Output, Working Costs and Dividends.

The Gold Mining Industry of the Transvaal.

The preceding tabulated statement for the Transvaal is given in full as it is the most complete record of gold mining operation in the world. The yields, working costs and dividends, from 1887 to 1916, a period of 30 years, have been obtained by sworn statements to both Boer and British Governments.

The total output for these 30 years was £492,198,901, or about \$2,300,000,000. The yearly return for 1916, was £38,107,909, or about \$185,000,000, which was 40 per cent. of the world's output for that year. The dividends amounted to 24 per cent. for the whole period, but only 18.6 per cent. for the years 1915 and 1916.

There has been a great struggle to lower expenses, which have been reduced from 42 shillings to about 17 shillings per ton. The average yield has been downward, and fell from 49 shillings to 26 shillings. It would seem the Transvaal fields have reached their maximum output and are on the down-grade.

The Rand Gold Mines are greatly favored in the fact that coal is found in close proximity to the gold. Also, native labor has been moderate in its wage demands, and outnumbers the white workers nearly 8 to 1, thus allowing skilled white workers opportunity for generous pay, which they have obtained.

The existence of gold in Rhodesia has been known for many years but material gold returns only started in 1898, and have steadily increased until 1916, when the output amounted to over \$19,000,000. There was a falling off, however, in 1917, of nearly two million dollars. The total production from 1898 to 1917, inclusive, amounted to \$194,672,165. At the present time the output is depressed by labor and supply conditions, and although the territory for mining operations is vast, with still unknown possibilities, there have been no new discoveries of late.

The yield up to 1847 was obtained from the Eastern coast; from 1848 to 1872, largely from the placer mining in the West; and from 1873 to date, by combination of placer and lode mining and recovery of gold from refineries.

Gold dredging in the United States dates only from 1896, and since that date the production of gold has been estimated at \$120,103,117.

In 1916 the greatest amount of placer mining, including dredging, was done in Alaska, where over 60 per cent. of the gold was thus recovered, and in California, where 38 per cent. was recovered.

All of the gold mining corporations of the United States do not make public their yields, costs, or profits, as is the case in the Transvaal. This government does not make demand for such information. Some of the largest and best managed, however, give most complete and generous information, which can be found in the transactions of mining societies, mining journals and handbooks. There would appear to be no reason for secrecy in gold mining returns, as it is the one business in the world that does not face competition in marketing its product.

Lode or quartz mining in the United States and Alaska produces 75 per cent. of their output. For the world, the percentage is much greater. In South Africa practically all the output is from this source, and shafts as deep as 5,000 ft. have been sunk on the Rand to develop the conglomerate deposits.

In the United States, lode mining has been conducted in great variety of formations and deposits varying from narrow veins of banded quartz with high per ton yield, to great irregular masses of low-grade ore. The gold is often associated with tellurium and other minerals. When pay has given out at shallow or moderate depths, explorations to depths of 4,700 feet, or over, have very often been justified.

The treatment of the ores depends upon their richness and association with other minerals, and the processes for recovery mostly in use are the jaw and gyratory crushers, for the larger rocks, followed by stamp mills, ball mills or rolls, for finer crushing, then plate amalgamation, by which in certain ores the greatest gold return is obtained; and concentration by vanners, shaking tables or oil flotation devices. The concentrates are treated by smelters, chlorination or cyanide works. After stamping or amalgamation the whole pulp is often economically treated in bulk by cyanide process.

Yields and Costs.

The yields and costs vary in different districts and in different mines in each district. The greatest gold producers have been mines of low or moderate yield per ton, but with great mass occurrence and good conditions for economical working. The best example of such mining is the Homestake Mine in South Dakota, which has been working since 1875, and has produced over \$147,000,000, the ore not averaging over four dollars a ton and costs ranging from 2½ to 3 dollars per ton with dividends \$40,000,000 or 27 per cent. of the output.

The records of the Alaska Treadwell Group of Mines started in 1885, and brought up to June, 1916, showed there had been crushed and treated 26,000,000 tons, yielding \$63,000,000 or \$2.37 per ton, and at a cost of \$1.42 per ton. The workings were extended to a depth of 2,300 feet, some of them were under the sea and the majority of the mines were flooded with water on April 21, 1917, and are now closed.

Lower yields and lower costs have been obtained by the Alaska Juneau Company and the Alaska Gold Mines which are only a few miles distant from the Alaska Treadwell Mines. Working on a large scale has only been started at these mines recently. In 1916 the Alaska Gold Mines crushed nearly 2,000,000 tons, giving a yield of 97 cents and at reported costs of 73 cents. The Alaska Juneau's large mill has only recently been put into operation. It is anticipated their yields and costs will be still lower. These are the lowest yields and costs known in gold mining. Hydro-electric power is used and all natural conditions ideal for cheap working.

The Mother Lode.

The Mother Lode in California, on which a 10-stamp mill was started in 1852, has been prospected or worked over an area of 125 miles, and has produced, according to estimates, over \$230,000,000 in gold. At two of the mines, shafts have been sunk to vertical depths over 4,000 feet. Many mines, however, have been abandoned at moderate depths owing to failure to make them pay. The early returns per ton from the Lode were much higher than recently, which do not average over \$4 per ton. Some old abandoned mines have lately been opened up again and by hydro-electric power and better system of mining and management made to yield substantial profit.

A notable case is that of the Plymouth Consolidated Mines, in Amador County, on the Mother Lode, reopened after an idleness of 24 years, liberally equipped by capital and costs reduced to about \$3.00 per ton.

The North Star Mine, in California, is a good illustration of a persistent but narrow vein of quartz, worked under good management, and being made to pay moderate profit for a very long period. The mine was discovered in 1851, and since then to 1917 has produced 1,470,000 tons, yielding \$18,610,000, or an average yield

of \$12.66 per ton. The total dividends have amounted to \$5,137,000 or about 35 per cent. of the yield. The returns for 1916 show a yield of \$10.42 per ton, with costs at \$6.26 per ton.

An example of very rich yield, but with short life, is found in the case of Gold Fields Consolidated Mines, Nevada. Here, within eight or nine years \$50,000,000 have been taken out, but the yield has fallen from 38.50 a ton in 1910 to 7.52 in 1916. The costs must have been moderate on account of the magnitude of the lode.

The Portland Mine, in Colorado, is another rich telluride mine. It has produced over \$40,000,000 with an average yield of \$27 per ton. The dividends, however, have not amounted to over 20 per cent., as a great amount of development, dead work and costly mining and reduction have been necessary.

Effect of Present Economic Conditions on Gold Production.

The writer was in California and Montana in December, 1917, where he had an opportunity of discussing with a number of operators, managers, and engineers the effect of the present economic conditions on the future output of gold as also the proposed excess war profits tax.

As labor and supplies go up, so must the cost of winning gold be increased, and the purchasing power of gold decreased. An index as to the decreasing purchasing power of gold is obtained by noting some of the increases in cost of supplies used in its obtainment, some of which are given in the table below.

The advance in costs of hydro-electric power has been small. The cost of coal and petroleum varies in different localities, but where necessary to use, is a serious advance in cost of operations under power cost.

ADVANCE IN THE COST OF MINING GOLD.

Labor (about)	20%
Steel (in California)	40 to 280%
Manganese steel (largely used in dredging) ..	130%
Explosives	75%
Quicksilver	93%
Lumber	125%
Machinery, etc.	75%
Miscellaneous	10 to 200%

Some companies with liberal margins between profit and loss can continue to work under present, or even much worse labor and supply conditions, but the excess war profits tax may so operate as to induce them to curtail outputs. Some of the mines working on very small margins are being closed down gradually and others may be kept going for a time by reducing development work and up-keep of plant, and generally marking time while hoping for better future conditions. There has been a fear among operators that through the workings of the Priority Board there may be difficulty in obtaining transportation and other necessities to keep their mines in constant operation.

It is my view that the elimination of all excess profit taxes on gold mining and the encouraging of maximum outputs might in reality bring in greater revenue to the Government than the tax; for larger dividends paid to shareholders would mean greater revenue from individuals.

Gold Standard.

Almost all countries of the world have as their financial basis the legal standard of gold. Only a few retain the double standard of gold and silver—Italy alone among the combatants.

Prior to the war, while there was freedom in trade and inter-communication between the different coun-

tries, the prices of various commodities were regulated both from within and without by the operation of the laws of supply, demand, and competition, and stabilized by the intrinsic value of gold.

The debts of the principal belligerents at the time of their entering the war and those contracted since their entrance, as also an estimation of further debts per year, are given in a very rough and approximate manner in the table hereunder. They are sufficiently accurate, however, to illustrate the danger of the world's financial situation.

DEBTS OF PRINCIPAL BELLIGERENTS.

Allies:	Pre-War	War	Total to Dec., 1917	Future yearly estimate
Great Britain.....	\$3,500,000,000	\$23,350,000,000	\$26,850,000,000	\$6,700,000,000
France.....	6,346,000,000	11,754,000,000	18,100,000,000	4,400,000,000
Russia.....	4,544,000,000	16,300,000,000	20,844,000,000	5,000,000,000
Italy.....	2,900,000,000	6,300,000,000	9,200,000,000	2,500,000,000
United States.....	1,200,000,000	7,000,000,000	8,200,000,000	14,000,000,000
Total.....	\$18,490,000,000	\$64,704,000,000	\$83,194,000,000	\$32,600,000,000
Central Powers:				
Germany.....	\$5,000,000,000	\$20,650,000,000	\$25,650,000,000	\$6,000,000,000
Austria-Hungary.....	4,000,000,000	12,200,000,000	16,200,000,000	4,000,000,000
Turkey and Bulgaria.....	800,000,000	1,100,000,000	1,900,000,000	350,000,000
Total.....	\$9,800,000,000	\$33,950,000,000	\$43,750,000,000	\$10,350,000,000
Grand Total.....	\$28,290,000,000	\$98,654,000,000	\$126,944,000,000	\$42,950,000,000

The table shows at a glance the great difference between the debts incurred by the Central Powers and those of the Allies. Taking into consideration the number of combatants and the necessary munitions and supplies used by them, is it not evident that the Central Powers are getting far more value for their debts contracted than the Allies?

As regards the stock of gold on hand in the world and the amount held by the United States, used as money and security, the following quotation is given from the Report of the Secretary of the Treasury, the United States, 1917, page 24, viz.:

"The gold monetary stock (coin and bullion used as money) in the United States on November 1, 1917, is estimated at \$3,041,500,000. The increase in the past 10 months has been \$174,500,000; in the past three years \$1,236,500,000; while in the past five years it has been \$1,161,333,000. In five years the portion of the world's gold monetary stock held by the United States has increased from approximately one-fifth to more than one-third."

This indicates that the calculation made previously in this paper of the gold reserve, corresponds closely with the estimate of the Secretary of the Treasury.

Accepting \$10,000,000,000 as the proper gold reserve of the world, it may be calculated that at the beginning of the war the gold reserve was 35 per cent. of the total debts of the belligerents, while at the present time, it is only about 8 per cent.

Gold Coins are Certificates from Nature of Man's Work.

When prices of labor and commodities are so advanced that it is not possible for the majority of the gold mines of the world to work at any profit, then labor and supply prices must become lower, or gold becomes automatically demonetized.

Gold coins can be considered storage cells of human energy, as to obtain them labor of hand and brain must be expended; in fact, they are thus charged with human electro-motive force. They are able to give out strong genial currents of trade confidence, circulating and binding trade, and bringing together different industries and peoples in different lands; their value is not founded on the fiat of any one or more legislative bodies of one or more countries that may be experiencing fleeting prosperity, but they are certificates from nature of man's work and accomplishment.

The electro-motive force of the storage battery cells depends not only on the amount of the electricity poured into them, but also its pressure or intensity. In electrical parlance, the rate of flow is known as the amperes and the pressure the volts, while the power, the watts.

In the gold cells filled with human energy, the amperes can be considered the number of workers and the volts the forces and tools placed at the disposal of the workers by discovery, science, and organization. The watts may be considered the labor force stored in the cell of coin.

In the mention of the labor elements poured into the cells, it must be understood that labor should include the work of managers, engineers, metallurgists, chemists, overseers, mechanics, and other skilled laborers, as well as the more unskilled work of drillers, trammers, shovellers, etc.

The electric storage battery of cells can be rendered useless or burnt up by excessive charges of current; they can also dry out and stop working, or be feebly active should there be an insufficient number of cells in the circuit to do the work demanded.

Translating these conditions to the human electro-motive coin cell, the value of gold can be destroyed by its too great abundance and its too great ease of obtainment. History is almost uncanny in showing how visions of super-abundance as seen or painted by owners and miners, have been doomed to disappointment, and how, considering time and averages, nature has demanded full toll in labor for her gold.

To Cut Off Supply of New Gold would Devitalize Coinage.

The electric storage cell can dry out and disintegrate unless refreshed with new current. Should the obtainment of new gold cease while drafts on the old coins are vastly increased, the whole storage battery of gold energy may get so out of adjustment as not to do useful work and gold would become demonetized and the accumulated labor energy of centuries past, locked up in old coins, become inert and valueless. Should all gold mining stop or very radically diminish, this would be the result.

As long as this country, or in fact any country, continues to measure values by a gold standard and pledge its credit on this basis, in the long run the cost of obtaining new gold supply must fix its limitations to the rise in wages and commodities. Gold is a sluggish governor and seems at times inoperative, but its plentifulness and cost of obtainment is ever operative, though not the only factor in the rise and fall of prices.

The great value of the gold coins is that they represent past labor achievements and can not be duplicated in the future without equivalent labor effort. Promissory bills or notes, or contingent division of profits made by either governments, banks or individuals, can be made mere scraps of paper almost overnight by war, revolution or commercial failure, but for thousands of

years gold, while showing fluctuation in purchasing power, has ever been valuable.

Our government securities and liberty bonds, pledged on a gold basis, take the place of gold coins only as long as the people in this and foreign countries have faith that the Government can make good its promises. When this is seriously doubted by the many, gold will go to a premium.

The great gold reserves of the past would not be so necessary if the recognition of the fundamental necessity of measuring gold values in units of labor necessary to win it were better recognized and insisted upon by governments that pledge their credit on a gold basis. Safely to lessen gold reserves while upholding the legal gold standard is the great financial problem of the day for this and other countries.

To attempt to adjust the value of the gold coin by changing its weight in fine gold by government fiat, would be to take away all intrinsic merit from the gold standard and result in confusion and utter lack of financial faith and confidence.

The temptation to enlarge obligations and thus reduce gold reserves to an inadequate amount and meet the difficulty by refusing to pay coin for gold pledges, also has great financial dangers.

The Functions of Money.

The conception and definition of money has been one of the most fruitful subjects of disagreement, argument and books known to man. It would seem, however, that the main functions of money are first, facilitating exchange; second, a means of estimating comparative values of commodities.

The unreality of paper money is forced upon the writer by his study of gold, the happenings of the time and the outlook for the future. Money must in a large measure be based on sentiment and good faith, for money, even including gold, has no intrinsic value except as an incentive or stimulant to future human enterprise, effort and labor. Its stored value vanishes when the mass of the people repudiate it. When faith in it gives out, those that may seize and wish to make new divisions will find only waste paper in the bonds, notes and securities so eagerly desired and coveted.

Money can be converted into reality only by working masses led by efficient officers, and who not only make use of the muscular energy of the masses, but harness into service all the impersonal obedient servitors that discovery, invention, science and engineering have placed at the command of man, and which force far exceeds all the muscular energy of man.

The payers of income tax in 1915 did not amount to more than one-third of one per cent. of the population. The envied rich amount to only a fraction of this number. They may enjoy pride of possession in the paper showings of their bank deposits and lists of securities, also the power it gives, but their absorbing power of that which money can really give to them individually is very small and confined largely to what they and their families can eat, drink and wear. All other possessions they must share or pass on to others.

The rich are merely deflectors, gates or valves in energy currents. The greatest wealth by the individual has been obtained by organizing labor and producing the necessities of the many at the lowest prices and taking small profits per unit, but with the greatest number of units.

As labor in its broader sense has been organized and stimulated to produce a maximum amount of commodities, it provides for its own necessities and comfort as well as that of the few and makes possible a greater

division of such commodities among themselves. Thus, great production is beneficial to the many as much, and in proportion more, than to the few.

The decennial census of 1910 shows that above 93 per cent. of the male population of the United States, over 21 years of age, is occupied in gainful pursuits. A far more difficult problem than the destruction of capital would arise among the workers should the present order of things be suddenly abolished, which would be how a fair, satisfactory, stimulating division of salaries and wages could be arranged and enforced among the workers, so that they would have more leisure and at the same time obtain more wants and necessities.

Any advance in wages of one class of workers must in fairness be followed by proportionate increases in the wages of other classes and as the laborer's wants and requirements for subsistence and comfort are dependable on his fellow-worker, so must the cost of his subsistence increase as his own and other wages are raised. Thus, in the end no material gain can be obtained by labor unless there is some corresponding advance in the output of his work.

The Government at the present time is the greatest employer of labor and purchaser of commodities. The danger of allowing the prices of commodities to rise above the future cost necessary for obtaining gold, it is hoped has been made plain. Certainly the Government should insist on the stoppage of all classes of profiteering, but how is it possible to fix prices of any commodity and make low bids possible unless there is some limit fixed upon wages and salaries?

The war must be won and it will take money as well as men to accomplish it. However, it does not help matters to pledge credit unnecessarily to please or placate either labor or capital, and the more we get for money on a gold basis at the present time the less will be the burden of debts incurred on future generations, which must of necessity be paid by the mass of the people rather than the few.

The Allies Must Uphold the Gold Standard.

The financial integrity of the country has been pledged on a gold basis. As 90 per cent. of the gold output of the world comes from the Allies' territories, as a war measure it is plain that it is to the advantage of the Allies to uphold the gold standard. For the past 10 years the world's yearly output of gold has been almost stationary, and the present high cost of labor and supplies are acting very seriously against any increased production.

To stop gold mining in a time of financial stress, as has been indicated, would be like closing the doors of a bank when a run is made upon it. It therefore must be evident that it is vital for this and all Allied countries to encourage gold mining as far as possible.

Gold Mining Should be Encouraged.

Unfortunately but little help can be directly extended to the gold industry, but, as far as possible, encouragement should be given, for while the war may have proved profitable to any other class of industry in the matter of earnings, certainly it has been seriously injurious to the gold industry.

Indirectly, the gold industry, as well as new issues of Government bonds, can be greatly helped by the reduction in prices of all necessary commodities, and this certainly should be seriously, judiciously and fairly taken in hand by the Government.

The war is to be won by the efficiency, harmony and morale of the workers behind the firing lines as much as by the exercise of these qualities by the soldiers at the front. The right conception of what gold, and in fact

money in any form, has the power of doing, or not doing, seems to the writer a matter of most vital concern at the present time. A better understanding of this problem, he believes, would tend to knit together governments, labor and capital and make for efficiency, harmony and happiness.

Gold Production in French Colonies

There has recently been published by the National Museum of Natural History, Paris, an interesting paper by Prof. A. Lacroix, entitled "Les Gisements de l'or dans les Colonies Francaises." In this paper Prof. Lacroix deals with statistics of production and the modes of occurrence of the metal in the various colonies of France. The statistics cover the production for the years 1902 to 1915, both inclusive. During this period the greatest production was in 1909, when gold to the value of approximately \$4,512,118 was exported from the colonies; the lowest was in 1914 when the value was \$2,732,807.

As Prof. Lacroix points out the French colonies occupy but a modest place as gold producers, but he believes that when the territories which they embrace are properly explored and prospected the output of the metal will be largely increased.

The French colonies may be divided into two great groups: (1) Martinique, Tahiti, etc., largely of volcanic origin and in which conditions for the occurrence of gold are not so good, and (2) those colonies which are made up largely of ancient rocks, Madagascar, French West Africa, Guiana and Indo-China among them furnish the gold production; but in very unequal proportions.

Gold was discovered in Madagascar in 1845. But, fearing the effects on the people of prospecting and working the deposits, the Queen, Ranavalona I., prohibited, under severe penalties, searching for the metal and this decision was strictly maintained until 1886. At the latter date the prohibition was removed and certain mining concessions were granted. French occupation in 1896 gave an impetus to prospecting. The year of greatest gold production since then was 1909 when about \$2,040,000 was exported. In 1913 the output was about \$1,139,000.

In French West Africa the auriferous areas are numerous, but up to the present production has been small. Among the territories in which gold has been found are those of Senegal-Niger, Guiana and the Ivory Coast. In 1915 the gold exported from these colonies amounted to about \$109,500.

Guiana is the largest gold producer of the French colonies. In the period since 1900, the year in which there was the largest export was 1908, when it amounted to \$2,400,000. The discovery of placers in French Guiana dates from 1853.

In all the French colonies the gold that has been worked occurs chiefly, or exclusively, in the native state. An exception is found in a deposit in Annam, Indo-China. This deposit, the Bong-Miu, in crystalline schists is complex. Auriferous pyrite and galena predominate, the latter also carrying some silver, associated with which are blende, mispickel and chalcopyrite. The production of gold and silver from this mine in 1915 had a value of \$68,800.

Prof. Lacroix' paper contains interesting notes on the character of gold deposits in the several colonies

and gives a good summary of his views on the subject of laterization, of which he has made a special study.

W. G. M.

THE ENEMY MUST NOT BE ALLOWED TO KEEP FUEL AND IRON LANDS.

Mr. D. B. Dowling, President of the Canadian Mining Institute, at the recent meeting in Montreal, pointed out the importance of Germany's conquests of fuel and iron lands. He said, in part:

"Were peace declared without evacuation, the territories now held by Germany are such that France would lose an appreciable amount of coal and probably 85 per cent. of her iron ore. Her manufactures then would be confined to textiles and the non-metallies, and Germany would have the preponderance both in coal and iron over all Western Europe. Britain would have much less coal than Germany, and the demands for economy coincident with a realization of the possibility of its ultimate exhaustion would slow up manufacturing and naval activity in the former country and give Germany a commanding lead in the competition for world trade."

CANADA'S KHAKI COLLEGE.

The following notes are taken from the London "Graphic," March 16th, 1918.

"More than one Canadian soldier has told me, in answer to the usual question as to after the war plans, 'I think I shall go back to school.' At the Canadian Soldiers' College, Seaford, Sussex, such boys as these, and their older companions, whose ordinary schooling, but not their complete vocational training, was finished long ago, are going back to school, evening after evening, in their spare time of soldiering.

"The president of this wonderful college is the Dean of the Faculty of Applied Science in the University of British Columbia, Major R. W. Brock, M.A., F.G.S., M.I.M.M., F.R.S.C. He has a number of other degrees, mostly American, and he knows all about geology and metallurgy and mining, subjects of great importance in a country still rich in undeveloped resources.

"The department of engineering, with a McGill man, Major Davis, D.S.O., B.A., B.Sc., at its head, includes many subjects useful both in the army and out of it."

The Granby Consolidated Mining, Smelting & Power Co. has begun the construction of a coking and by-product plant at Anyox, B.C. The company has coal lands on Vancouver Island, which are now being developed to produce about 200 tons coal per day by the end of the year.

ONTARIO FLUORSPAR PRODUCTION INCREASING.

Fluorspar is in good demand in the United States and recent prices in New York quoted in New York are around \$35 per ton for prompt shipments, and \$28 per ton for 1918 contracts.

Fluorspar mining in Ontario has never been a big industry; but considerable shipments are being made from mines near Madoc. Shipments increased from 1,283 tons in 1916 to 4,213 tons in 1917. Production this year is expected to be much larger.

The Wellington and Munro property near Madoc was acquired in February by the Mining Corporation of Canada, which is now operating the property.

CARBOCOAL*

An elaborate series of experiments has been conducted during the past 3 years at Irvington, N.J., which has resulted in the perfection of a process for the manufacture of smokeless fuel from high-volatile coals, and for the recovery and refinement of the coal-tar products derived therefrom. These experiments have been financed by Messrs. Blair & Co., of New York, and were conducted under the direction of Charles H. Smith, the inventor of the process.

The low-temperature distillation of coal has interested investigators for many years. Sporadic attempts have been made to solve the mechanical problems, but until the Smith process was developed, they were not carried to conclusions of economic value. The present coal shortage and the increasing demand for smokeless fuels make this subject one of timely interest.

Mr. Smith's experiments have resulted in the production on a commercial scale of:

1. A fuel, called Carbocoal, which, for convenience in handling, is prepared in briquet form.
2. A yield of tar more than double that obtained in the ordinary by-product coking process.
3. Ammonium sulphate in excess of that normally recovered in the ordinary by-product coking process.
4. Gas, in amount approximately 9,000 cu. ft. per ton of coal carbonized, which is at present used in the process.

The essential features of the Smith process are the two distillations carried on at different temperatures, first of the raw coal and second of the raw briquets. The raw coal, after being crushed, is distilled at a relatively low temperature, 850° to 900° F., and the volatile contents are thereby reduced to the desired point. The result of this first distillation is a large yield of gas and tar, and a product rich in carbon, termed semi-carbocoal. The semi-carbocoal is next mixed with a certain proportion of pitch obtained from the tar produced in the process, and this mixture is briquetted. The briquets are then subjected to an additional distillation at a higher temperature, approximately 1800° F., resulting in the production of carbocoal, the recovery of additional tar and gas, and a substantial yield of ammonium sulphate.

Carbocoal is dense, dustless, clean, uniform in size and quality, and can be readily handled and transported long distances without disintegration. It is grayish black in color, slightly resembling coke, but its density more nearly approaches that of anthracite coal. It is manufactured in briquet form and can be made in any size, from 1½ oz. to 5 oz. The larger sizes are better suited to locomotive purposes, and the smaller sizes for domestic use.

Heretofore, devolatilized fuels, such as coke, have not attained the high rates of combustion desired for locomotive, marine and general steam purposes; and their greater displacement has operated against their general use where transportation cost of stowage space has been an important factor. Carbocoal overcomes these objections. It is actually a relatively soft but tough form of carbon, readily attacked by oxygen in combustion; and for this reason, requires much less draft than other high-carbon fuel.

Carbocoal has been tested by the Long Island Railroad; by the Pennsylvania Railroad at its testing plant at Altoona; by the Carolina, Clinchfield & Ohio Railroad; and by the United States Navy.

These tests have demonstrated that the fuel is smokeless; that it will evaporate from 8.5 lb. of water at a combustion rate of 100 lb. per square foot of grate surface per hour, to 12.8 lb. of water at a combustion rate of 27 lb. per square foot of grate surface per hour, from and at 212° F., per pound of fuel fired; and that it requires no greater draft than bituminous coal. A maximum combustion rate of 166 lb. per square foot of grate surface per hour has been reached for a short period.

Carbocoal has been found particularly suitable for the following purposes:

1. Marine and locomotive service, where limited grate area and restricted boiler capacity demand efficient fuel; where smoke is objectionable or dangerous, as in the case of ships in time of war.
2. Stationary boilers, where smoke pollution of the air is offensive and dangerous to health.
3. Domestic uses, including furnaces, stoves, ranges and open grates, where cleanliness is a desirable factor.
4. Kilns, drying and roasting ovens, and all purposes where an intense and uniform heat is desired.
5. In metallurgical furnaces, as a substitute for coke.
6. Gas producers.

TORONTO'S NEW ELECTRIC STEEL PLANT.

Since the beginning of 1917, there has been built in Toronto a steel plant that is entirely electrical in operation. Ten Heroult furnaces are used and power is obtained from Niagara Falls. The plant was built for British Forgings, Ltd., a company organized to carry out certain work for the Imperial Munitions Board. Several of the furnaces have been in operation for some months remelting scrap steel, which has naturally been produced in Canada in much larger amounts than usual during the war. Some interesting details of the construction of the plant are given in "Iron Age."

Work was begun on the Ashbridge's Bay site, recently reclaimed, in February, 1917. Steel was made in the first furnace on June 16, 1917, and the other furnaces were completed on the following dates: June 26, June 30, July 5, July 7, August 11 (three) and August 16 (two). The consulting engineers were Perin & Marshall, New York. General direction of the plans for the plant were in charge of Col. David Carnegie, of the Munitions Board.

The furnaces are of six-ton's capacity, erected with tilting mechanism on the casting floor level and the furnaces proper on a reinforced concrete charging floor, 12 feet above the casting floor. Electric power consists of three-phase, 25-cycle, 13,200-volt, alternating current, supplied by the Hydro-Electric Power Commission of Ontario. Transformers supply current to the furnaces at 100 volts. Three electrodes, each 17 inches in diameter, are used.

The plant has been making 12-in. ingots and 6-in. shells, all of which are being turned into munitions in Canada. The Hydro-Electric Power Commission had the contract for electrical work; the Toronto Harbor Commissioners for foundation work and the Hamilton Bridge Company for the structural steel.

BOUNTY FOR IRON IN BRITISH COLUMBIA.

The Government of British Columbia proposes to aid the establishment of an iron and steel industry by offering a bonus of \$3 per ton of pig iron produced from ore mined in the province and \$1.50 per ton made from imported ores.

*Excerpts from a paper by Charles H. Smith, read at the Colorado meeting, American Institute of Mining Engineers.

OBITUARY.

John McMartin.

John McMartin, of Cornwall, Ont., member of the McMartin-Timmins-Dunlop syndicate of La Rose and Hollinger fame, has passed away. Mr. McMartin has been chosen to represent Glengarry in the Dominion Parliament and was in Ottawa for the recent opening of Parliament in spite of failing health. He had hoped to live to play a part in reconstruction after the war in the country in which he had done so much pioneer work.

—British & Colonial Press.

JOHN McMARTIN

In 1904, in association with his brother, the late Duncan McMartin, he became interested in the LaRose mine, and later in the Hollinger and other mining interests. He became the vice-president of the Hollinger Mines, vice-president and director of the Canadian Mining Finance Company, Ltd., president of the Princess Realty Company, president of the Labrador Pulp and Lumber Co., president of the Motherlode Sheep Creek Mining Co. of British Columbia, and was officially connected with many other notable Canadian corporations.

About a million and a half from Cobalt was John McMartin's reward. Railway contracting and participation in the Rossland movement had not enriched him. Cobalt, the fortuitous visit to Cornwall when his brother, Duncan McMartin, was endeavoring to procure capital for the LaRose discovery, made the McMartin-Timmins-Dunlop a millionaire quintette—but an unspoiled one. Consequently—and reciprocating the generosity—Noah A. Timmins and L. Henry Timmins included the Messrs. McMartin and Dunlop in their Porcupine gold mining ventures—first in importance of their kind on the North American Continent.

PERSONAL

Mr. W. J. Dick has resigned as mining engineer of the Commission of Conservation, and will be sales manager of Western Coal Mining Company.

Mr. H. Foster Bain has been appointed assistant director of the U.S. Bureau of Mines.

Mr. T. J. Brown, formerly general superintendent for the Nova Scotia Steel and Coal Co., has joined the staff of the Dominion Coal Co.

Samuel W. Cohen has resigned as general manager of the Crown Reserve Mining Company, Limited, and Porcupine-Crown Mines, Limited, which position he has held for ten years, to take up general consulting mining engineering practice with headquarters at Montreal. He remains with both of the above companies as consulting engineer.

Dr. J. M. Bell was in the Cobalt district recently and visited the Keeley mine.

Mr. A. R. Whitman was in Toronto last week, and is now in New York, where he is opening an office at 43 Exchange Place.

Mr. Alex. Sharp has been appointed general manager of the P. Burns Co., Ltd., Coal Mines, Sheep Creek, Alberta.

Mr. S. S. Fowler, general manager for the New Canadian Metal Co., operating the Bluebell mine at Riondel, Kootenay lake, B.C., has been receiving treatment by a specialist in ear troubles in a hospital in San Francisco, California.

Mr. Henry Maluin, head of a French syndicate that for some years has been operating a hydraulic placer-gold property each gravel-washing season, has returned to Atlin district of British Columbia for the current season's work. He spent last winter in the United States, instead of in France as in other winters. His company's gold leases are on Otter Creek, Atlin.

Mr. M. E. Purcell, of the Consolidated Mining and Smelting Co.'s mining staff, is back at Rossland, B.C., from a trip to San Francisco, California, and Portland, Oregon.

Mr. T. M. Daulton, manager of the Placer Mines Co., after spending the winter in Seattle, Washington, is again hydraulicking on Otter Creek, in Atlin camp, British Columbia, having returned north in April.

Mr. M. S. Davys, for many years engaged in mining in West Kootenay district of British Columbia, first in Nelson mining division, and in later years in the Slocan, has been at Berkeley, near San Francisco, California, for the winter. His latest enterprise was that of equipping the Kaslo concentrator with improved machinery and plant and operating it in treating zinc-lead ore from the Lucky Jim mine, Slocan.

Mr. Melbourne Bailey, manager of the several hydraulic placer-gold properties situated in Cariboo district of British Columbia and known as the John Hopp placer-gold mines, is again at Barkerville, Cariboo, after having been at his home in Tacoma, Washington, for the winter. Supplies for the season have been shipped for Barkerville, and preparations for resuming hydraulicking were well advanced last month. Mr. Hopp will also be at Barkerville shortly.

The assay office of the Rosebery-Surprise Mining Company at the company's concentrator near Rosebery, Slocan Lake, B.C., has been destroyed by fire.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

Announcement has been made that the restriction as to quantity of lead ore that will be received at the Consolidated Mining and Smelting Co.'s smelting works at Trail, West Kootenay, has been removed, and that now all lead ore offering will be accepted. It is stated, though, that the lead recovered will still have to be pooled, as was agreed between the company and Kootenay mine-owners some time ago, under which arrangement only twenty-five per cent. of the value is payable to shippers shortly after receipt of the ore, payment for the remainder being deferred until after the lead shall have been sold by the smelting company.

Little, if any, progress has yet been made in the direction of investigating matters in connection with the alleged unfair treatment of independent mine-owners who have been shipping, or who claim to have been prevented by restrictions imposed by the smelting company from shipping lead-bearing ores to the Consolidated Co.'s works at Trail. It is reported that there has been some delay in providing the requisite financial assistance, and that consequently members of the committee chosen for the work have not been disposed to undertake it until after the indispensable money provision shall have been made. The suggestion has been made that a Royal Commission be appointed instead of the committee of district mining men chosen at a meeting held earlier in the current year at Nelson, B.C., but it is thought that the complaining mine-owners would have little chance of a result in their favor should such a commission carry out the requested investigation, the opinion being that some of the allegations against the smelting company would be found to be not sustained. Meanwhile time is passing and it may be that conditions will adjust themselves to such an extent that the demand for an investigation will not be pressed. Those who are most unfavorably affected by the change in smelting rates and other charges of the last year are the smaller shippers, who have found that under the altered conditions it has not been practicable to continue operating, not at any rate where proceeds of ore mined were required to finance operations.

EAST KOOTENAY.

Metalliferous mining has shown little change in recent weeks in the several mining divisions of East Kootenay. Against an output from the Sullivan mine in March of 10,101 tons, chiefly of zinc ore, giving an average of 326 tons a day, there was a total of 4,430 tons, or about 316 tons a day, for the first fourteen days of April. Other shippers during the whole of those periods were the Paradise, 525 tons; St. Eugene, 119 tons, and Isaac, 28 tons.

Coal mining in Southeastern Kootenay continues active, with production less than it would be were more miners obtainable. The Crow's Nest Pass Coal Co. is operating mines at both its Coal Creek and Michel collieries, and is making coke at both Fernie and Michel. With smelting works in both West Kootenay and Boundary districts, and at Northport, in the State of Washington, requiring coke, the demand is well maintained, so that a ready market is available for the output of the Crow's Nest Pass Coal Co.'s ovens.

WEST KOOTENAY.

Ainsworth.—Much of the ore that has been shipped from the Bluebell mine at Riondel, across Kootenay lake from the town of Ainsworth has been oxidized lead ore. Last year about 1,000 tons of ore of similar char-

acter was shipped, also to Trail, from this mine.

The Florence Silver Mining Co. is operating its concentrating plant again, not on full time though, but running only one shift daily. The chief producing mine in Ainsworth camp is now the No. 1, owned by the Consolidated Mining and Smelting Co.

Slocan.—Not much ore from Slocan mines went to Trail during the first half of April, the only mine appearing on the list having been the Standard with a total of 206 tons. No ore was received from the Lucky Jim zinc mine, which during March shipped 289 tons out of a total from Slocan of 575 tons, which, however, does not represent the total production for that month, ore having also been shipped to smelting works in the United States.

Nelson.—Shipment of ore from the Yankee Girl mine has been resumed. This property is situated near Ymir, in the central part of Nelson mining division. Some years ago a comparatively large quantity of ore, containing gold and silver was shipped to Trail and other smelting works, but in more recent years production had been suspended and the development of the mine at a lower level carried out on a scale that resulted in opening much ore. In addition to doing development work, the operators of the mine constructed an aerial tramway from the portal of the lower adit-level to the railway at Ymir, a distance of approximately one mile, thus affording transportation facilities not previously available. The cost of the development of the mine has been provided by the Buchanan syndicate of Fort Worth Texas, which, after the old Yankee Girl company went into liquidation, acquired the property under option of purchase and has since expended much money in developing and equipping it for ore production.

Ore receipts at the Consolidated Co.'s smelting works at Trail from mines in Nelson division, have been small during the current year, the total to April 14 having been less than 1,000 tons. The Consolidated Co.'s Molly Gibson mine, situated in the northeastern part of the division, north of the West Arm of Kootenay Lake, shipped 597 tons of silver-lead ore. This mine is near the head of Kokanee creek, which flows into the West Arm a few miles below Balfour. There is a concentrating plant at the mine. Transportation is by aerial tramway for the greater part of the twelve-mile distance between the mine and the landing on the lake. Another shipper is the Emerald, near Salmo, in the southern part of the division; its product is a lead ore, of which 242 tons had been received at Trail up to the end of the week closed on April 14. The Monarch-Beasley, near the Kootenay river, about nine miles west of Nelson, has this year shipped 84 tons of copper ore. Small shipments from the Salmo region comprise 23 tons of gold ore from the Ore Hill, above Sheep Creek, and 7 tons from the Aspen.

Trail.—Ore receipts at the Consolidated Mining and Smelting Co.'s smelting works here totalled 19,604 tons for the first two weeks of April; the proportion from mines operated by the company was 17,459 tons, while the remaining 2,145 tons was of custom ore. More than one-half of this ore was from the company mines in Rossland camp, which shipped 10,066 tons of gold-copper ore. The proportions from other of the company's mines were as follows: Sullivan, in East Kootenay, 4,430 tons of zinc ore; Emma, in Boundary district, 1,621 tons of copper-gold ore; No. 1, in Ainsworth camp, 1,003 tons of silver ore; Molly Gibson, in Nelson mining division, 203 tons of silver-lead ore, and High-

land, in Ainsworth camp, 84 tons of silver-lead ore. Among the custom ore shippers were the Le Roi No. 2 Co.'s Josie mine, in Rossland camp, 959 tons of gold-copper ore; the Bluebell, on the eastern shore of Kootenay lake, 389 tons of lead ore; the Standard, near Slo-can lake, 206 tons of silver-lead ore, and the United, in the State of Washington, 334 tons of copper ore. The total of receipts at Trail in 1918, to April 14, inclusive, was 122,722 tons, of which 107,944 tons was ore from mines operated by the company and 14,778 tons was of custom ore.

NORTHERN ONTARIO.

Keeley Silver Mine May Be Re-opened.

The re-opening of the Keeley mine in South Lorrain is under consideration. The property was under option to English interests at the time the war broke out, and at that time, owing to the fact that it was expected the war would be of short duration, an extension of time on the option was asked for and granted, giving the holders of the option until one year after the close of the war to complete the terms of their contract. The result has been that the mine has remained in idleness ever since. The Keeley mine was equipped with a powerful mining plant during the years 1908-09, and at one time figured prominently in the affairs of the now defunct Farmers' Bank. A car-load of extremely high-grade ore was shipped, but the values did not prove consistent. A number of large veins carrying smaltite and low silver values are in evidence on the surface and the possibility of the property being operated with success appears to be good. The Keeley adjoins the Wettlaufer, which, along with the Currie property, is being operated by the Pittsburg-Lorrain Syndicate, producing very substantial quantities of silver. In the neighborhood of two million ounces of silver has been produced at the Wettlaufer since the development of the property was first started.

Adanac Development Work.

The development work under way at the Adanac Mine, Cobalt, is causing more than ordinary interest, owing to the fact that the drift at the 310-ft. level is nearing the point where the 30-in. vein in evidence on the surface of the property should soon be cut. This calcite vein carries considerable quantities of cobalt. A study has been made of the geological structure of the property by one of the leading geologists of the country and his report is favorable. The drift is in the Keewatin formation. The Keewatin lies like a blanket over the underlying diabase. The shearing already encountered in the drift is approaching the southward slope of the diabase and is very pronounced. Approximately one hundred feet of drifting was done during the month of April, and if the same rate of progress is maintained for the present month, the large vein on the surface should be cut about the last week in May. The work of drifting is costing in the neighborhood of \$18 per foot, which compares well with the best records established in the camp. The company have upwards of 280,000 shares of stock in the treasury, and are financed for the carrying on of operations for the balance of the present year, before which it is anticipated results at the property will place it on a self-sustaining basis.

Will Re grind Sands and Cyanide the Slimes.

The Mining Corporation of Canada is making preparations for the treatment of half a million tons of tailings deposited in the bed of Cobalt Lake from the Cobalt Reduction mill. The mill is being altered to permit of the treatment of 300 tons per day

at once and the capacity will eventually be brought up to about 700 tons per day. A pump, with a capacity of about 1,000 tons per day, is being installed to feed the mill and at the same time place a large amount of the tailings close to the mill to permit of operating during the winter months when the lake is frozen. The method of treatment of these old tailings will be that the sand will be pumped to the classifier, the slimes will be treated in the cyanide section of the mill, and the sands after regrinding in the tube mills will be run over the concentrating tables and treated by oil flotation. The work of altering the mill is now under way.

Exploring the Waldman Property.

Exploration of the Waldman property of the Mining Corporation of Canada is being aggressively prosecuted. A number of narrow calcite veins have been found, in the conglomerate, but so far these have not been found to carry commercial silver values. Two machines have been employed exploring the conglomerate until the past week, when a third machine was added to expedite the work.

Mr. S. Renaud has optioned the McGregor group of claims in Gillies Limit, a few miles south of Cobalt.

Ophir Development Work.

The drift at the 410-ft. level of the Ophir Cobalt property has entered most promising ground, and now the management is sinking a winze from the 410-ft. level to the contact, between the diabase and Keewatin. Another drift running diagonal to the main development drift at the 410-ft. is being run for the purpose of tapping nine veins previously located on the 300-ft. level, some of which are of a very promising character. The management look forward to important results from this development. A comprehensive development programme has been financed at a favorable price.

Good Ore Found on Green-Meehan.

Working at a depth of 245 ft. from a winze at the old Green-Meehan property, a wide vein carrying considerable silver, cobalt and nicolite has been encountered. The high-grade streak carries values of upwards of two thousand ounces to the ton, over a width of three inches, while considerable good grade mill rock is in evidence on either side of the vein. In the earlier working of the mine a crosscut had been driven to a point on an upper level where the vein should have been encountered. The present management is understood to have removed a considerable amount of waste rock and debris from this working, with the result that the vein was revealed at precisely the point where it should occur. Here also the values in the vein are said to be of a fairly high grade. The new vein encountered at the 245-ft. depth occurs in a diabase dike close to, and running parallel to, a diabase Keewatin contact. Drifting is proceeding on the new vein.

Hopeful for Temiskaming.

The exploration of the Temiskaming Mine is being actively conducted at and above the 500-ft. level as well as at the 1,600-ft. level. On the 300-ft. level, two veins are being followed which are yielding fair returns, and the management is highly optimistic as to the future of the company. Recently, After R. Whitman made an exhaustive study of the property, and while his report has not been made public as yet, his remarks relative to the future outlook for the mine are understood to have been optimistic and present operations are being conducted along the lines of his suggestions.

Will Develop Molybdenite Property.

A new company is being organized to be known as the Indian Peninsula Mining Company to take over molybdenum ores along the Hurricanaw River, near Amos, Que., on the National Transcontinental Railway. Results already obtained from development work done is spoken of by local engineers in the highest terms, considerable ore bodies being now exposed. A 100-ton mill is to be erected as soon as possible and the treatment of ore commenced. Mr. H. G. Mathewson, banker, Cobalt; Mr. Balmer Neilly, of the Penn-Canadian Mines, and Mr. Frank Groch, of the Groch Centrifugal Flotation, Limited, are interested in the enterprise. Mr. Groch has contracted for the building of the mill.

Another Good Year for Nipissing.

According to the annual report of the Nipissing Mining Company, 4,212,000 ounces of silver was produced at a cost of 25.117 cents per ounce, and the total receipts were approximately \$3,700,000. The yearly average price at which silver was sold was 83.19 cents per ounce at Cobalt, which was nearly two cents higher than the average New York price for the metal during the year. The known ore reserves show a silver content of about 8,100,000 ounces, or approximately 1,000,000 ounces less than the reserves of December 31st, 1916. However, by reason of the advance in the price of silver, the reserves are estimated at something like \$700,000 more than as of December 31st, 1916. The surplus as of December 31st was \$2,731,000. This is an increase over the previous year of about \$750,000. The stockholders received during the year \$1,800,000, and there has been paid to shareholders since July, 1906, to January, 1918, approximately \$16,750,000. As no large veins were discovered during the past year, the production of nearly 4,000,000 ounces of silver naturally resulted in some decrease in the ore reserves. The underground reserves were decreased about 60,000 ounces; the surface dumps tonnage making up the difference of about a million ounces between the two years. The ore reserves at the present time are estimated to contain 8,076,540 ounces of silver.

Discovery at Three Star Mine.

An important discovery was recently made at the property of the Three Star Mining Company, Cobalt, formerly the Calumet and Montana Mining Company. The vein is said to be from three to five inches in width and in places to carry high silver values. A crew of over twenty men and three machines are employed in operating the Three Star property.

Mr. Whitman Goes to New York.

Mr. Alfred R. Whitman has removed his offices from Cobalt to New York. Mr. Whitman has been instrumental in solving many of the geological problems met with in the mining camps of Northern Ontario. With offices in New York, he will not only continue his connections in the north country, but will also extend the scope of his work to other fields. As a geologist, Mr. Whitman has gained for himself an enviable reputation throughout the north country.

More High-grade Ore at Chambers-Ferland.

The vein recently located at the Chambers-Ferland property of the Aladdin-Cobalt Mining Company continues to yield high grade. At one time, the vein was found to have faulted, but it has since been relocated, and at present continues strong.

Will Re-open Savage Mine.

The McKinley-Darragh Mining Company has de-

cided to re-open the Savage section of their property and an aggressive plan of operation will be carried out. It is estimated that there are from eight to ten acres of conglomerate formation on the property which as yet has been unexplored and which is now considered to have good possibilities of being productive. In addition to this new prospective area, a considerable amount of low-grade ore is now in sight. With the increase in the price of silver, it is possible to mine ore of a lower grade profitably now, that three years ago did not pay for the handling.

250 Claims Staked in Doherty District.

Already some 250 mining claims have been staked in the Doherty district, about twelve miles south of Temagami. This number of claims comprise about 10,000 acres. Among those interested in the district are a number of Cobalt mining companies, and it is quite evident a large amount of work will be done during the next few months. The geology in the vicinity of Doherty resembles to some extent that of the Cobalt district. Although as yet insufficient work has been done in the district to give any definite opinion as to its future possibilities, the outlook is at least promising.

Development Work at Genesee Mine.

Development work at the lower workings of the Genesee is being attended with encouraging results. Recently a fault was encountered at the 500-ft. level, in which ruby silver occurred deposited in a fracture along the fault. It would appear that a silver vein is in close proximity to the present point of operations. Further work will be carried on along the fault. Drifting is also proceeding on a promising vein at the 500-ft. level and has been carried for about 36 ft., at which point a stope has been started. The vein in the first round of shots in the stope widened out from about half an inch to one and a half inches in width. The Genesee lies adjacent to the Chambers-Ferland.

Patricia Mill Should be Ready Soon.

It is expected that the new mill at the Patricia Syndicate property at Boston Creek will be in operation by the end of the present month. The machinery is on the ground and the work of installation is proceeding rapidly. The equipment consists of a Blake crusher, Allis-Chalmers ball mill, a classifier, amalgamating plates and Wilfley tables. The capacity of the mill will be between 50 and 60 tons per day.

Underground developments continue highly satisfactory and the management anticipates no difficulty in keeping the mill up to capacity. With less than seven months between the date of breaking of the first ground and the commencement of production, a new record for mining operations will be established in this country. Mr. Charles O'Connell, formerly manager of the Tough-Oakes is manager and part owner of the Patricia. The property was formerly known as the Boston Hollinger. Development work here is rapidly proving the merits of the Boston Creek camp.

Will Develop Ontario-Kirkland Property.

Arrangements are being made for the commencement of operations on the property of the Ontario-Kirkland Mining Company, which lies a short distance south from the Wright Hargreaves and with the Hunton and Canadian Kirkland comprise the south auriferous zone of the Kirkland Lake camp. This zone appears to parallel the north of main zone along which are situated the present big producers of the camp. The recent favorable developments on the Canadian Kirkland are attracting interest in that direction and a further big

expansion may be expected. It is reported that the company have made arrangements for the expenditure of \$50,000 in development and the work will begin shortly.

Machinery on Way to Otisse Property.

The machinery for the development of the Otisse property at Fort Matachewan is well on its way to the property. The diamond drilling equipment is already on the ground and will be in operation in the course of a few days. Most of the heavy machinery for the mining plant has been transported as far as the east branch of the Montreal river from which point it is proposed to move it over the river on floats or barges, after which but a short haul remains to the property. Navigation on the river and lake is now open.

May Re-open Tommy Burns Property.

It is rumored that Mr. Clarence R. Pope is making arrangements for the re-opening of the Tommy Burns property in Shaw Township, near Porcupine, which has been idle for several months.

Barite Mill at Premier Langmuir.

It is expected that the mill at the Premier Langmuir Barite property will be in operation early in June. The property is situated in Langmuir township, a few miles south-east from Porcupine. Delay in the delivery of certain parts of the equipment is holding up the commencement of milling operations.

Davidson Mill in Operation.

A \$9,000 gold bar has been shipped from the Davidson property in the Porcupine camp as the result of the initial run of the new mill, and was the result of the treatment of relatively low grade ore. The mill is steadily increasing its output and the grade of ore now being put through is high. The mill has been so constructed as to permit of increasing the capacity to 100 tons per day with very little difficulty and additional cost. It is expected the management will pursue this course in the near future. The ore body recently developed at the mine has a decided pitch to the south and appears to be an entirely new body, quite independent of the original body that showed on the surface. At least this is the opinion of two mining engineers who have recently examined the property. Should future developments establish this as fact, it will give to the property much greater possibilities.

Elliott Kirkland.

The shaft at the Elliott Kirkland property has reached a depth of about 480 ft. When the 520-foot is reached a station will be cut and the vein crosscut for at this depth. Owing to results encountered on the Kirkland Lake Gold, which adjoins the Elliott Kirkland, it is anticipated that the vein will show considerable enrichment and further widening out at this point. More than ordinary interest attaches to the development of Elliott Kirkland during the next few months as it will prove the consistence or otherwise of their promising orebody which has been located at the 300-ft. level, and have a definite future bearing on the development of the property.

Schumacher.

Labor conditions in the Porcupine camp together with the increased cost of supplies has resulted in the curtailing of milling operations at the Schumacher. However, with a return to more normal conditions in either the supply of labor or the cost of materials this company would be in a position to immediately take advantage of this change and their shareholders will eventually reap the rewards of their conservative policy for the development of their properties.

First Clean-up at Lake Shore Plant.

The results of the first clean-up at the Lake Shore mill at Kirkland Lake has exceeded the most sanguine expectations of the management. Approximately \$40,000 was the result of a twenty-three days' run. The mill is designed for the treatment of 60 tons of ore per day, thus the grade of ore must have averaged approximately \$28 per ton. Costs are being held down to about \$8 per ton of ore treated, and with the grade of ore being treated the profits run in the neighborhood of \$20 per ton or at the rate of \$1,200 per day. This is at the rate of about \$52,170 per month, or an annual output of \$626,240. The estimated net profits on production are equal to \$432,000 annually, which is equivalent to twenty-one per cent. on the par value of the 2,000,000 shares issued capital of the company. The mine is not encumbered with any indebtedness, the sale of treasury stock being sufficient to place the property in its present paying position.

Mining Corporation Makes Second Payment on Rickard Township Claims.

The Mining Corporation of Canada has made a second payment on the group of claims taken under option last summer in the township of Rickard. Considerable surface and underground work has been done on the property. The main shaft has reached a depth of one hundred feet and lateral work has been under way at this point for some time. A fairly extensive mining plant has been taken in and diamond drilling is under way. A force of about fifty men are engaged and the development of the property is being conducted in an aggressive manner. Success on this property would no doubt be followed by a good deal of exploratory work in the district wherein the rock formations are concealed by a heavy overburden of clay.

Lightning River Claims Will Be Developed.

Claim owners in the Lightning River district are being given permission to proceed with their development work and a large number are leaving for the district from day to day. The new road has been completed to within a few miles of the discovery group of claims and a small grant of money has been provided by the government to those interested in the district to help complete the work. It is expected that if the district proved up to expectations, further grants of money will be forthcoming for the improvement of the road.

MOLYBDENITE DEPOSITS OF ONTARIO.

In the recently published 26th annual report of the Ontario Bureau of Mines, Dr. A. L. Parsons describes molybdenite deposits of the province which he visited in May, June and September, 1916. According to Dr. Parsons nearly every molybdenite deposit of commercial importance in eastern Ontario is near the contact of granitic rock and crystalline limestone.

EUXENITE IN ONTARIO.

A radio-active mineral, euxenite, was discovered in 1915 in a feldspar quarry near Maberly, Lanark Co., Ontario, by J. A. Morrow. Specimens forwarded by Mr. T. W. Gibson, Deputy Minister of Mines, to England, were analyzed by the Imperial Institute. Dr. W. G. Miller and C. W. Knight visited the quarry in June, 1917, and some account of the deposit is given in the recently issued 26th Report of the Bureau of Mines.

CARELESS CAGER CAUSES HOISTING ACCIDENT AT MOND NICKEL MINE.

While hoisting a cage containing ten men from the twelfth level, 2,600 ft., of the Mond No. 1 mine at 3 a.m., April 27th, the cable broke at a point about 40 ft. above the cage, when the cage was about 400 ft. above the twelfth level.

The men had all been hoisted from the eleventh level 2,300 ft., and the cager on that level had come to the surface and reported that he had pulled the chairs on that level. The cage in the west compartment was at the twelfth level and the cage in the east compartment, which had just come from the eleventh level, was sent to the twelfth level. The cager had left the chairs in at the eleventh level in the east compartment and the cage stopped at that level, the 300 ft. of cable looping over and dropping down the west compartment. The cage in the west compartment with ten men on was rung up and was hoisted through the coils of cable hanging in this compartment. The cable coiled around the cage and around the dogs until at a point about 100 ft. above the eleventh level the coiled cable became taut and the hoisting cable in the west compartment broke at a point about 40 feet above the cage. The cable coiled around the dogs prevented the safety catches from working, but at the same time acted as a brake between the dogs and the guides, so that the cage did not fall, but slid back slowly to a point about 100 ft. above the eleventh level the coiled cable became taut and held the cage. None of the men in the cage received serious injuries.

The cables were 3,800 ft. long when new, were 1½-inch (8 x 19) plough steel, and had a breaking strain of 67 tons. The hoist is a 400-h.p. electrically driven one. The circuit breaker acted at the same time as the cable broke.

B. Lonyez, the cager, was brought before Magistrate Stoddart at Sudbury on May 6th and sentenced to three months in gaol and a fine of \$50, or an additional one month.

HAMILTON COMPANY SECURES IRON ORE PROPERTIES IN MICHIGAN AND MINNESOTA.

The Steel Company of Canada has, in conjunction with other steel companies, secured two iron ore properties, one on the Gogebic and one on the Mesabi range. The ore will be paid for on a royalty basis. Shipments from the Gogebic range mine will be available this year and from the Mesabi late in 1919.

WILL PRODUCE COKE AT HAMILTON.

President Robert Hobson, of the Steel Company of Canada, reports that all the contracts for the by-product coke oven plant, to be installed at Hamilton, have been let. It is hoped that production of coke will begin in November. The company's blast furnaces at Hamilton will be supplied.

INDIAN PENINSULA MINING CO.

The Indian Peninsula Mining Co. has been formed to operate the molybdenite properties of St. Maurice Mines, Ltd., near Amos, Quebec. Frank Groch and W. E. Simpson of Cobalt are interested in the enterprise.

HOWE SOUND PAYS DIVIDEND.

The Howe Sound Co. has announced a dividend of \$99,205. This company is a holding company, controlling the Britannia Mining & Smelting Co., of Howe Sound, B.C.

GOOD ORE DEVELOPED IN COAST COPPER MINE.

Encouraging progress is reported to have been made by the Coast Copper Company in connection with the development of its property in Quatsino mining division of Vancouver Island, B.C. Control of the company is held by the Consolidated Mining and Smelting Company. The property consists of a large group of mineral claims, situated between Hardy Bay on the east and Quatsino Sound on the west side of Vancouver Island. Development includes five adits and a shaft, 700 ft. depth having been reached by this work. On both the 500 and the 700 ft. levels about 600 ft. of drifting has been done. Much chalcopryrite ore of good grade has been opened, beside which there is a large body of magnetite in which copper, gold and silver occur.

Electric Power
for
Mining Operations
is
Safe, Convenient and
Economical

The engineering problems solved in putting electric power to work in these and other industries are many and intricate. Production of electrical equipment suited to this work and in quantities required is an important part of this company's service to Canadian industries.

Any problem involving the use of power can be simplified by the application of electricity. The Canadian General Electric Company is well equipped to lend valuable assistance in working out such problems and is glad to co-operate with miners and electrical and mining engineers in every possible way.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

- Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

USERS of the Callow Cell are naturally interested in knowing how the decision of the United States Circuit Court of Appeals for the Third District, in the Miami case, will affect their interests.

As we understand the prevailing opinion of Judge Woolley in the Miami case he has interpreted the Supreme Court decision in the Hyde case as meaning that "*invention resides not alone in the critical proportion of oil, but also in air and agitation,*" and again, "*in the co-action of the critical proportion of oil and air effected by an agitation greater than, and different from that which had been resorted to before,*" resulting in a froth concentrate of economical value," and further, that the Supreme Court did not limit the patent to "*agitation by mechanical means,*" but to agitation of a violent and persistent kind; "*it mixes the oil with the metal of the ore. This is old. Then, by its greater intensity and longer duration, it stirs the pulp into a froth.*"

Thus, this decision of the Third Circuit Court of Appeals has a most important bearing upon the art, because it holds that the mixing of the oil with the mineral is old, but it **leaves open the use of oil in connection with aeration-cells.** Meanwhile the idea of a "*critical*" proportion of oil has been dis-

proved by practice in several mills within a short time after it was promulgated.

Judge Woolley says further, concerning the Callow Cell: "*Aeration is direct, and is not the result of or caused by agitation. On the contrary, agitation results from aeration and such agitation, though present in some measure, is not even approximately of the violence and duration of the agitation of the patent. The operation in the Callow Cell certainly possesses these distinguishing features from operation of the process where aeration is caused by agitation.*"

The Court further confirms this important dictum by saying: "*If the only agitation to which the pulp was subjected (after such agitation as in the prior art was necessary to mix the oil and ore) was the agitation of the Callow Cells, we would not say that that agitation amounted to or was the equivalent of the violent agitation of the patent disclosure and constituted infringement.*"

Apparently users of the Callow Cell may feel assured they do not infringe the method of agitation described in U.S. Patent No. 835,120 (less than 1% oil), No. 962,678 (soluble frothing agents), No. 1,099,699 (phenol or cresol in the cold without acid) since all three of the patents are of the same process, dependent upon a certain degree of violence and length of agitation and the production of the same characteristic froth, as set forth in their claims.

(Signed) J. M. Callow.

Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

QUE.

Speed up your rock drilling!

Time studies indicate serious efficiency losses in drilling rock, due to the time spent in changing steel, shifting mountings, keeping the drill and steel in line with the hole, etc.

You can reduce this idle time and increase your rock-cutting efficiency remarkably by selecting

SULLIVAN Pnufeed Rotators

The Pnufeed Rotator is a self-rotating water hammer drill mounted on an automatic air feed. Its features include:

- 1.—No crank, no feed screw—instead, forward and back air feed.
- 2.—Few mounting changes. Two holes, 18 inches apart, can be drilled without touching the arm clamp.
- 3.—Automatic alignment of drill and steel with holes.
- 4.—One-man operation throughout.
- 5.—Feed of variable strength.
- 6.—Single throttle control of drill and feed.

The Pnufeed Rotator is a practical, all-around drill. It is quickly changed from drifter to stoper, or to a hand sinker.

Ask for Bulletin 670-F.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

The Direct Connected "PRE-2" Air Compressor Means Cheap Power

Cheap Input Power

- 1 Direct Drive saves floor space, lowers installation and overhead expense.
- 2 The "PRE-2" is driven by a standard self-starting synchronous motor; by helping the power-factor this not only brings good terms from the electric power company but cheapens the heavy copper item in the wiring expense.
- 3 Two-stage compression — with the thorough intercooling of the "PRE-2" — means a saving of 15 to 20% on input power.

Cheap Output Power

- 1 The "Ingersoll-Rogler" Air Valve by its lightness and quick action gives maximum air input per H.P. input.
- 2 The "Ingersoll-Rogler" Air Valve by its simplicity, together with the "flood" lubrication, combine to reduce upkeep expense.
- 3 The Clearance Regulator with the special stop for low load running insures highest economy at all loads.

You do not buy a large compressor without having all the facts you can gather---a short letter to our nearest branch office, a three-cent stamp and you have our bulletin 3026 with full details of design and performance.

"TESTED"

The Last Word in Rock Drills

TESTED—the clinching quality or proven durability—means much to rock drill users. It means sure service—a long life for the Drill—and durability wherever used, with no long stops for repairs, because it is proven service.

Hundreds of Cleveland users after a long service of constant use against all conditions have sent back the verdict that for durability, labor and time saving "Cleveland" excels all.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping. Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all Infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

TRANSPORTATION BUILDING
MONTREAL

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

MASSCO

ASSAY EQUIPMENT

The laboratory or assay department cannot be too careful in selecting equipment. Operations here are just as important and sometimes more important than those in the mine.

Use Massco Assay Equipment with full confidence. It has passed all of our tests—it will meet your approval.

The Samson Jaw Crusher

The intermediate crusher for the laboratory. Will rapidly crush the hardest rock as well as sticky ores, giving a uniform product. Has a large capacity and will not choke with sticky material that does not adhere to the plates.

Can be cleaned while running at full speed. Furnished in two sizes. The Massco for hand power, capacity 150-250 lb. per hour, weight 250 lb. The Number 00 for belt drive, capacity 300-500 lb. per hour, weight 300 lb.

The McCool Pulverizer

For grinding ore samples or preparing control pulps. Grinds from $\frac{1}{4}$ in. to any fineness. The only pulverizer with equal wearing on both discs. Dust proof. All parts readily accessible for cleaning.

CHEMICALS

We carry in stock the highest grade C.P. Chemicals for Laboratory requirements. We are selling agents for the Shattuck Chemical Co., who manufacture high-grade Molybdic Acid, 85%; Molybdic Acid, 100%; Ammonium Molybdate, Uranium Salts, Phospho-Tungstic Acid, Sodium Tungstate, Potassium Permanganate, etc.

All guaranteed to be strictly in accordance with analysis shown on each label. The Molybdic Acid is a remarkably high-grade product for phosphorous determination.

The Geo. Taylor Hardware Co., Cobalt, New Liskeard and Cochrane, carry in stock Massco Clay Goods, Crucibles, Muffles, Scorifiers, Roasting Dishes, Lindsay Oil Furnaces, Heusser Balances and Samson Laboratory Crushers. Send them your inquiries.

KLIM
IN POWDER FORM

Use As Needed Always Fresh

One of the advantages in letting Klim solve your milk problem is that any quantity can be used as needed without the possibility of spoiling the remainder. Open a tin of Klim and use just the amount required at the moment for cooking or table, replace the lid and the remaining Klim will keep fresh and sweet indefinitely. Klim will not sour, freeze nor spoil. It is pasteurized, separated milk in powder form—all of the solids minus the water. The natural milk flavor is unchanged.

Buy Klim in the 10 lb. tin—it makes 40 qts. If your supply house does not carry Klim, write to us direct.

As Mr. Lindsey pointed out at the annual meeting of the Canadian Mining Institute, the fuel problem of the Canadian West is largely one of transportation. In this the West is not peculiar, for shortage of locomotives and cars is obviously one of the chief causes for fuel shortage in Central Canada and the United States. Unfortunately the shortage of cars in the West and the high freight rates on coal coming east are not due to temporary causes.

The Granby Company evidently intends to make itself as independent as possible of others so far as fuel is concerned. By opening a coal mine on Vancouver Island and installing a by-product coke oven plant at Anyox, the company has taken steps which should insure a satisfactory fuel supply.

REPORT OF MUNITION RESOURCES COMMISSION

The Munition Resources Commission, appointed by Order-in-Council in November, 1915, "for the purpose of instituting an enquiry respecting the supply and sufficiency of raw materials in Canada required for the production of munitions of war, and the best means of conserving the same," has issued its first report.

One of the matters taken up by the Commission was that of assisting Canadian firms to obtain supplies of tool steel from the United Kingdom. It was arranged that all orders for such steel for munition work should be subject to certification by the Commission. Later the Commission was called upon to certify to the requirements of other Canadian users. This procedure was followed for a year; but in Feb., 1917, the Department of Trade and Commerce was asked by the Imperial Government to act as a local Priority Authority for Canada and the Commission's certification was no longer required.

Acting on the advice of the Commission, the Department of Customs placed an embargo on export of scrap steel in January, 1916, in order to assure the necessary supply for munition plants. In the latter part of the year export under license was permitted; but the Commission recommended that such export be prohibited after Jan. 1, 1917. Export of turnings and borings was, however, continued in 1917. In February, 1918, the Shell Scrap Department of the Imperial Munitions was organized to purchase from munitions contractors all their heavy scrap at \$24 and steel turnings at \$12 per ton. The steel companies are required to pay this price plus freight charges. On July 12th, 1917, authority to issue licenses for export for scrap steel turnings and borings was withdrawn.

The Commission interested itself in the agitation for refining of copper and nickel in Canada, and recommended that the Government offer inducements that would lead to the erection of a copper refinery here. The Commission urged the Government to insist upon a nickel refinery being established at once, the International Nickel Company having announced that it proposed to establish one. The Commission recommended the guaranteeing of certain securities of the British America Nickel Co., which had announced its intention of erecting refineries for nickel and copper.

The Commission has carried on a number of investigations concerning mineral resources; Professor J. C. Gwillim, Dr. W. F. Ferrier and Dr. W. L. Uglow being engaged for this work. Certain special investigations were undertaken for the Commission by members of the staff of the Department of Mines. The report includes some account of the results of these investigations. Special study was made of chromite, magnesite, manganese ores, molybdenite, tungsten and zinc.

The Commission recommended that development of our mineral resources could be assisted by educating the general mining public in all matters directly concerning the mining of minerals and their preparation for the market. It advised the establishment of additional technical laboratories.

The Commission has undertaken the preparation of an inventory of Canadian minerals required for war purposes. Dr. W. F. Ferrier is in charge of the work of indexing the information obtainable.

As appendices to the report, are published the reports on Steel Scrap Investigations by J. Dix Fraser, Construction and Operation of an Electrolytic Copper Refinery by J. E. McAllister, and Summary of Field Work in British Columbia, Alberta and Saskatchewan by W. F. Ferrier.

The U.S. War Industries Board has announced the commandeering of platinum, palladium and iridium and the fixing of prices of \$105, \$135 and \$175 per oz. respectively. Considering that the United States is depending almost altogether on imports of platinum from countries that might dispose of their product to German agents, it is not surprising that our New York contemporary objects to the price fixing mania. We may be permitted, however, to call attention to the fact that it will be necessary for America to depend upon Russia and Columbia for platinum only so long as the present practice of wasting Ontario's platinum and palladium is continued. Much of the wasting has been done in the United States; where mattes from the Sudbury district are refined.

The decision of the Court of Appeals in San Francisco in the case of Minerals Separation vs. Butte & Superior appears to be that the Minerals Separation patents will not apply when over one-half of one per cent. oil is used. Such a decision will be greatly to the advantage of those using the flotation process.

Hopes for the establishment of an iron and steel industry in British Columbia have been brought nearer to realization by recent action on the part of the Provincial and Dominion Governments. British Columbia has offered a bounty of \$3 a ton on pig-iron manufactured in that Province from local ore and \$1.50 a ton for iron from imported ore. The Dominion Government now offers to purchase all pig-iron produced by blast furnaces erected during the next two years.

U.S. Government Sale of Nickel.

Washington, May 21.—President Wilson has issued a proclamation pursuant to the terms of the trading with the enemy act directing the alien property custodian to sell at private sale, with or without public or other advertisement, 279,232 lb. of nickel, the property of Hammar & Co., of Hamburg, Germany, and Stockholm, Sweden, and other enemies unknown. This nickel is now in possession of the American Dock Co., Tompkinsville, Staten Island, N. Y., where it was warehoused some time ago by the owners. Persons interested in the purchase of this nickel can learn further

details concerning the time, place and terms of sale by addressing the alien property custodian, Washington.

GOVERNMENT ENCOURAGES IRON INDUSTRY.

The Government of the Dominion of Canada has decided upon a policy of encouraging new Iron and Steel Industries in Canada by offering to purchase all pig-iron produced in the country by all new blast furnaces erected during the next two years. It is understood that it will undertake to accept three years' output and that prices paid will be governed by the market conditions at the time.

As to the effect of this decision on the development of an iron industry in British Columbia, Hon. Wm. Sloan, Minister of Mines, in an interview said that the action undoubtedly was very encouraging. He pointed out, however, that the knowledge of what was to be done was not detailed enough to permit extended comment. For instance it was not stated whether the prices to be offered for British Columbia pig iron would be Western prices or Montreal quotations. If the latter the advantage to the producer would be negligible because of the cost of transportation. He was sure, however, that it was not the intention of the Federal Administration to place the manufacturers of this section under such a disadvantage. The Minister pointed out that the object of the Province in offering the bounties indicated was to encourage the Iron and Steel Industry in its initial stages and, because of this, he felt that, possibly, the Dominion Government might have seen its way clear to render assistance to those undertaking to carry the industry further by the refinement of pig-iron which could be done by the subsidizing of the output of rolling mills. This had been the course adopted by the Dominion in its policy of bounties of some years back, which was largely responsible for the laying of the foundation of the very large Iron and Steel Industry of Nova Scotia.

Mr. Sloan concluded:

"As I have stated, the action taken by the Federal Administration is encouraging. It is a recognition of the resources of British Columbia that is very welcome at present when we are trying to make a start in the building up of this very important basic industry. It undoubtedly will have the effect of lending confidence to those contemplating the investment of capital in the exploitation of the iron deposits of the West; assuring them, as it does, of the practical as well as the sympathetic support of both the Provincial and Dominion Governments."

Two news paragraphs published lately in the Daily Alaskan, of Skagway, Alaska, relating to Atlin, which in recent years has been the most productive placer-gold field in British Columbia, are as follows: "On account of the extremely deep snow this year, it is feared that a number of mines in Atlin camp will be unable to operate this coming season, owing to inability of the mine-owners to get in timber. The depth of snow in the woods is so great that it is utterly impossible to use teams." The second paragraph reads: "On account of the high freight rates and the advanced prices on all kinds of provisions and supplies, also on timber, and the increase in wages incident to the shortage of labor, it is believed that a number of Atlin mines will not be operated this season, nor until the war is over and conditions resume a normal status. Many protests are being made, but it is believed that nothing can be done to alleviate the situation."

Some of the Coal Producer's Problems ^{*}

By D. H. McDougall.

On the occasion of our last meeting of the Mining Society of Nova Scotia, I made reference to the part played in this war by coal, and the subsequent course of events has given the general public and ourselves a very lively appreciation of the value of our domestic fuel supplies. We have realized through actual trial and experience the bearing of fuel supply upon our national independence. A combination of labor shortage, inadequate transportation facilities and unprecedentedly severe weather conditions during the past winter caused a fuel crisis in the United States which, but for swift and drastic action on the part of the United States Government, would have brought about a national catastrophe, in which we also should have been involved.

We have realized that no nation can stand alone unless it possesses an adequate fuel supply within its own borders. Fortunately for Canada, the Republic to the south of us is our ally and companion in arms, and Canada has received most generous consideration from the United States in this matter of fuel supply.

Canada Will Have Same Treatment as United States.

Recently in Ottawa a representative of the Fuel Administrator of the United States told the assembled coal miners, operators, and transportation men of Canada, that Canada would receive the same treatment from Dr. Garfield as though it were part of the United States itself. We were told that in the distribution of the available coal supply of the United States the boundary line between the two nations would be absolutely ignored, and that so far as the distribution of this most vital munition of war was concerned, North America would be looked upon as being one nation with one common aim.

Fuel Supply and Transportation.

We have learned the intimate connection between fuel supply and transportation facilities. In this country of vast distances they are in fact practically indistinguishable one from the other. The problem of the utilization of the great bituminous and lignite fields of the Canadian West—as was abundantly demonstrated during the recent Fuel Conference at Ottawa—is altogether one of transportation.

I may remind you that the coalfields of Nova Scotia remained undeveloped, and the industry, which we so largely represent, did not emerge from its small beginnings until the transportation problem was solved, and the St. Lawrence market was opened to Nova Scotian coal by the provision of modern coal freighting vessels and of modern loading and discharging plants.

At the present time the enormous increase in the percentage of coal consumed within the Province of Nova Scotia itself, accompanied by declining outputs, has obscured the present importance of transportation in our own particular case; but this problem will revive and will face us in greater intensity whenever we seek to regain the St. Lawrence market as an outlet for Nova Scotian coal.

We have further learned that the value of fuel, and all questions of comparative excellence of fuels become considerations of a secondary character during times of fuel scarcity. We are learning to make the best of our own natural resources, and when fuel such as anthracite, possessing the desirable features of smoke-

lessness and high calorific value, cannot be obtained, we must perforce turn our attention to the utilization of such fuels as peat, lignite, and even wood.

The Fuel Controller of Canada has announced that it is extremely unlikely that United States anthracite will be available next winter in the prairie territory west of Winnipeg, which means that bituminous coal and lignites will have to be used as substitutes.

It is not an unmixed evil for a people so virile and enterprising as our own people to be thrown back on their own resources, because it naturally leads to development and progress and probably the discovery of unsuspected excellences both in our natural resources and in our ability to make the best of them.

I may, in passing, point out that the shortage of anthracite is not a mere phase originating in present conditions. No country in the world, unless perhaps it is China, has been so favored in the possession of anthracite resources as the United States. But that the anthracite fields there are approaching a period of comparative exhaustion is evidenced by the fact that very thin seams of anthracite are to-day being worked, seams which in the past it would not have been deemed worth while to operate.

The Intrinsic Value of Coal.

Another thing that we are learning is the intrinsic value of coal itself. Probably in regard to no basic raw material has there existed so widespread a misconception as in the case of coal. This misconception has not been confined to the general public, but it has extended to those whose daily business is the production and sale of coal.

The Selling Price Has Been Too Low.

The ultimate factors entering into the cost of coal have not been fully understood, and, without entering into detail, it may be briefly stated that coal has, in the past—both in Canada and in the United States—been sold at prices below the actual cost of production, when such cost is considered over the whole life of any given coalfield. Further, it may be stated that the material value of coal itself has been underestimated, and perhaps no raw material has been so wastefully and unscientifically consumed in the past.

We are learning that the price of coal is not a deciding factor in days of fuel scarcity. The important thing, the paramount necessity is to produce the coal; to produce it as cheaply as possible, but above and beyond all other conditions, to produce.

The United States has experienced the sharpest lesson in this connection. No small part of the barely averted catastrophe of last winter was due to the arbitrary fixing of coal prices in the summer of 1917. Any action in the fixing of prices which ignores the essential factor of production and does not simultaneously with the restriction of prices, provide for the stimulation of production, is a mistake and defeats its own object. In the case of a raw material of such fundamental and vital importance as coal, all government action should have as its first and guiding motive the increase of production.

Efficient Use of Men.

Increase of coal production does not necessarily mean the opening of new mines, but rather the reverse. There has been, throughout North America, a general reduction in the working force at the collieries. In

Nova Scotia this reduction of workmen has largely concentrated upon the actual miners and producers of coal, as would naturally happen, because the producing class at a colliery—by a process of natural selection—includes the men most fitted by physique and mentality for military service. This withdrawal of the most efficient members of the working forces has not been peculiar to Nova Scotia, but is a noticeable feature throughout all the coalfields of North America.

Under these circumstances of labor shortage, of a selected character, the obvious remedy for the unbalanced conditions which it has brought about is the concentration of the remaining workmen in the collieries best equipped to give the greatest production of coal. The most noteworthy feature of the existing labor situation at the collieries is the inefficiency of operation brought about by the unbalancing of the forces referred to, and concentration is the remedy.

Not only is concentration desirable from the point of view of productive efficiency at the collieries, but it is also necessary to conserve the transportation factor. The fewer the points from which transportation is required and the greater the tonnage which can be moved from these points, the less will be the call upon the motive power of the railways and upon shipping.

In view of the insistent calls of the Army for more and still more men, it appears quite hopeless to look for any large increase of coal production arising from the provision of additional employees, and, as in the case of the fuel itself, we must make the best of the man power we have.

Production of Coal is of Vital Importance.

The coal operators are fully alive to the necessity of increasing production where it can be achieved by the use of mechanical devices, and the labor shortage has already brought forth mechanical devices which will play an increasingly important part in the future development of the coal industry. Unfortunately, this avenue of possible increase of coal production is restricted by the difficulty of obtaining delivery of machinery, so for the present the only way by which coal production can be stimulated is that every man employed in the industry—no matter what his position—shall work to the full extent of his ability.

Our chief incentive to hard work should be the knowledge—and here you will pardon me if I repeat my statement of last year—that, “no single department of the machinery of modern warfare can move or act without coal.” Those of us who help in one way or another in the production of coal are privileged in that we are able by our personal endeavors to help or hinder in the prosecution of the War. In view of the critical condition of military affairs at a time when we are approaching the end of the fourth year of the struggle, I believe I voice the feelings of us all when I say that we need no further spur.

The metalliferous mining of the Nicola District, British Columbia, is improving. A railway is being built to the Canada Copper Company's property on Copper Mountain, near Princeton, B.C., and a concentrator is being installed.

The Voigt's Group of Copper Claims, Copper Mountain, have been bonded by the Canadian Mining, Smelting and Power Co., and soon will become one of British Columbia's producers.

CORRESPONDENCE.

Bore Hole Drilling.

Editor Canadian Mining Journal:

Sir,—In reading over the articles by Mr. Hitchcock, Mr. Harrington and Mr. Stone, on the merits of the various diamond drill core-barrels, it is rather surprising to note that the return water principle is discussed as if it were something new and better than the standard barrels. Mr. Harrington, who is well known to most of us in the diamond drilling business, is thoroughly qualified to give an opinion on the subject, as he has had a world of experience in drilling under widely varying conditions. He seems to have voiced the opinion generally held by drillmen; in saying that when conditions are such that it is desirable to use a double tube barrel, the ball bearing barrel without the return water feature is unquestionably the best. This barrel fulfills all the requirements of an efficient double tube barrel and the same cannot be said of any other type.

The double tube barrel was designed primarily to protect core from the washing effect of moving water. This is by far the most important consideration in double tube barrel design. The next most important improvement is the provision for preventing the rotation of the inner tube, thus eliminating the vibration and friction against the core and preserving it in the best possible shape. This, as has been explained, is accomplished by suspending the inner tube on ball bearings. In formations that are difficult to core, and where the maximum core recovery is of utmost importance, no other type can compare with it. It is true this is the most expensive barrel on the market; but Mr. Stone's statement that it is short lived is contrary to the writer's experience. Due to the almost entire absence of friction on the inside, there is little wear except on the outer barrel. The outside wear is probably less than on the other types, because of less grinding of core with the consequent wear from cuttings. In soft formation the regular practice for the past few years has been to dispense entirely with the single tube barrel and run only the double tube, because of the increased progress that can be made. A double tube barrel under such conditions will run a year or more, which is as much as any barrel will do.

The rigid type return water barrel, which Mr. Stone states is as good or almost as good as the barrel described above, fails to fulfill the two important functions of a double tube barrel in that it does not protect the core from moving water and does not protect it from friction or vibration. It probably would be better described as a modification of the single tube rather than a double tube, as the only difference in the action on the core is that the water flows upward around the core instead of downward. The friction remains the same as in the single tube.

While this barrel does not give the results that a regular double tube barrel does, it has some advantages when used in broken formation. When the single tube barrel is used, while the upward flow of water will wash away soft core, it will tend to loosen broken particles of core that become bound in the barrel and better progress can be made. It would seem that a barrel possessing this advantage would be used extensively in the Lake Superior district, where the rock is hard and more drills are used than in any other section of the world. The reason why it is not more extensively used, is because the return water feature is considered dangerous by contractors and drillmen in that section. Drillmen must be constantly on their guard against getting

the rods stuck. Invariably, sticking is caused by failure to wash away the cuttings from the outside of the bit and barrel. When this occurs on an ordinary barrel the pump stops and the water ceases to return at the top of the hole, an instant warning to the drillmen. With the water returning through the inner tube, it is difficult to determine how much, if any, water is passing up around the outside of the barrel, so that a bit may be stuck while the water is returning. This frequently results in not only the loss of rods, core-barrel and diamonds; but of the hole as well. It is rather common practice amongst runners, when this barrel is furnished, to plug the upper hole in the barrel; thus preventing the water returning through the inner tube and eliminating the danger of sticking. With the hole plugged, the barrel is the same as the simple rigid type. The fact that this is often done and that runners claim better results is not a very strong recommendation for the return water barrel.

From a drillman's standpoint, all drilling is either hard rock drilling or soft rock drilling and there is rather a distinct line between the two. Hard rock comprises the metal producing formations while soft rock means such formations, as fire-clay, salt, sulphur, asphalt, coal, gypsum, etc. The standard barrel for the former is the small single tube and for the latter the large double tube ball bearing barrel. If conditions are such in the so-called hard formations that it is desirable to use a double tube barrel, better results can be obtained by employing the soft rock practice of large hole and proper double tube barrel rather than by using small fittings not adapted to such conditions.

The foregoing opinion is based on twenty years experience in many parts of the world and is substantially the same as the views held by Mr. Harrington and most other experienced drillmen. Furthermore I believe it is in line with the practice of the Sullivan Company, who make all the barrels under discussion. As they are considered the leading authority on the subject it would be interesting to have their ideas.

Yours etc.,

J. G. GRATTAN.

Flower, Ont., May 22, 1918.

BLASTING COAL IN NOVA SCOTIA MINES.

Up to within very recent years the blasting of coal in Nova Scotia mines was accomplished by loose black powder, fired by squibs, but this practice has very properly been abandoned. In the damp mines compressed powder, or "pellets" are used. The charge is fired by an ordinary squib, sometimes ignited by a wire heated by contact with the safety lamp flame, and inserted through a small hole specially bored in the lamp glass. The use of squibs is with good reason coming to be regarded with disfavor, and powder fuses fired by electric batteries are being introduced. In the dry and dusty mines, or in mines where gas occurs, so-called "safety" or "permitted" explosives are used, as "Excellite" or "Monobel." These explosives are, of course, fired by a fulminate of mercury detonator, and electric battery. The quantity of explosive used varies with the nature of the seam, but from 4 to 7 tons of coal produced per pound of powder used, may be taken as usual practice.—F. W. G.

Mr. Maurice M. Summerhayes, formerly manager of the Porcupine Crown Mining company has been made manager of the Blueston Copper Mining company, Nevada, and has already left for Nevada.

PRINTED COPIES OF PATENTS.

By H. A. Budden.

Sir Robert Hadfield, head of the firm of Hadfield, Limited, Sheffield, in a recent address on Patent Law Reform, made the following statement:

"As an example of the antediluvian policy of our Empire on this question an Englishman in this country cannot get a copy of a Canadian Patent without sending to Canada, and even then he gets only a typewritten copy, as patent specifications are not printed there."

This condition of affairs in the Patent Office, Ottawa, is one that demands immediate attention.

The Canadian Patent Office have issued over 180,000 patents and Canada ranks seventh among the countries of the world issuing Patents for Inventions.

A copy of a British Patent costs 8 pence, while the U. S. Patent Office sell copies at 5 cents apiece.

A copy of a Canadian Patent costs on an average over two dollars and can only be obtained after considerable delay.

In the U. S. Commissioner of Patents' report to Congress for the year ending December 31st, 1917, the following figures are given relating to this subject.

Printed copies of specifications and drawings of Patents to the number of 2,511,082 were sold at five cents each, bringing to this Office on this account, \$125,554. For 1,277,184 copies sold to libraries the Office received \$1,612. The total received from the sale of copies of Patents was \$127,166.

Copies to the number of 1,097,550 were shipped to foreign governments and 142,640 copies were drawn for office use. The total number of printed copies of Patents distributed during the year was 5,354,136.

These figures show that there is a great demand for printed copies.

The public is interested in the publication of Patents because it has the right to know the terms of the grant of a monopoly in order to avoid infringement while the monopoly exists, and it has also the right to know what has become public property when that monopoly ceases.

The patentee is interested in the publication of patents as he would readily purchase a number of copies of his patent, to assist him in exploiting his invention.

The Patent Office is urgently in need of printed copies not only to supply the examiners' files, but also to fulfill an agreement with the U. S. Patent Office to exchange copies.

In Great Britain and the United States the libraries in all the great centres contain copies of patents for reference. In Canada it is necessary to go to Ottawa to make a search and even then the cumbrous typewritten copies, which are not properly classified, make a search difficult and tedious.

The Canadian Patent Act as it now stands provided for the printing of specifications and drawings in Section 63, subject to the approval of the Governor in Council.

Undoubtedly it will take a long time to print the 180,000 patents which have been already issued, but that is a matter for special consideration.

There is no doubt, however, that the system of printing specifications and drawings should be adopted at once and thus prevent the increase of arrears.

Canada has reached such a stage in her development that she should endeavor to be among the progressive nations, particularly in matters that concern her intercourse with other nations. Her present time of rapid industrial and technical advance demands a change from old methods which may have been suitable for a young country.

Tungsten Ore Deposits Near Falcon Lake, Man.*

By Justin S. DeLury.

The Falcon Lake District is part of an area which lies to the northwest of Shoal Lake and near the Ontario Boundary and which was prospected for gold several years ago. Throughout this area are signs of prospecting in the form of old prospect holes, stakes and claim lines. A few of the old claims are still held, but most of them have lapsed. A part of the District adjacent to Falcon Lake and that part which is of interest at the present time in connection with the tungsten finds was prospected last year for molybdenite and a brief report* appeared describing the occurrences of that mineral.

When the molybdenite deposits were examined, no signs of the presence of tungsten minerals were seen, though they were looked for in the pegmatites and associated quartz veins. Last winter some prospectors

midway between the main line of the Canadian Pacific Railroad and the Greater Winnipeg Water District Railroad. By good canoe routes and trails the prospects can be easily reached in a half-day from either railroad. Should the district go ahead as a shipping camp, means of transportation could be easily arranged. The accompanying map shows the location of the field and the means of access.

The principal geological features of the area were brought out in the above-mentioned report on molybdenite, so that it will not be necessary here to give more than a brief outline. The map shows the prominent geological outcrops with their approximate boundaries.

The principal rocks of the area fall structurally into two groups: a series of ancient schists and a later in-

Falcon Lake tungsten ore.
(White crystals are scheelite.)

J. MacMillan.
Discoverer of the scheelite deposit near Falcon Lake.

went into the District to stake more claims, and one of them brought out some fragments of rock, the weight of which attracted his attention. In March of this year these were recognized as pieces of high-grade tungsten ore; consisting of scheelite, a calcium tungstate, embedded in a mass of epidote crystals.

Two short visits were paid the District to examine the tungsten occurrences, and though little work has been done to show-up the properties, sufficient information was gathered to furnish the following brief paper giving a description of the ores and their manner of occurrence.

Compared with the positions of most Manitoba prospects, these are very favorably located, lying about

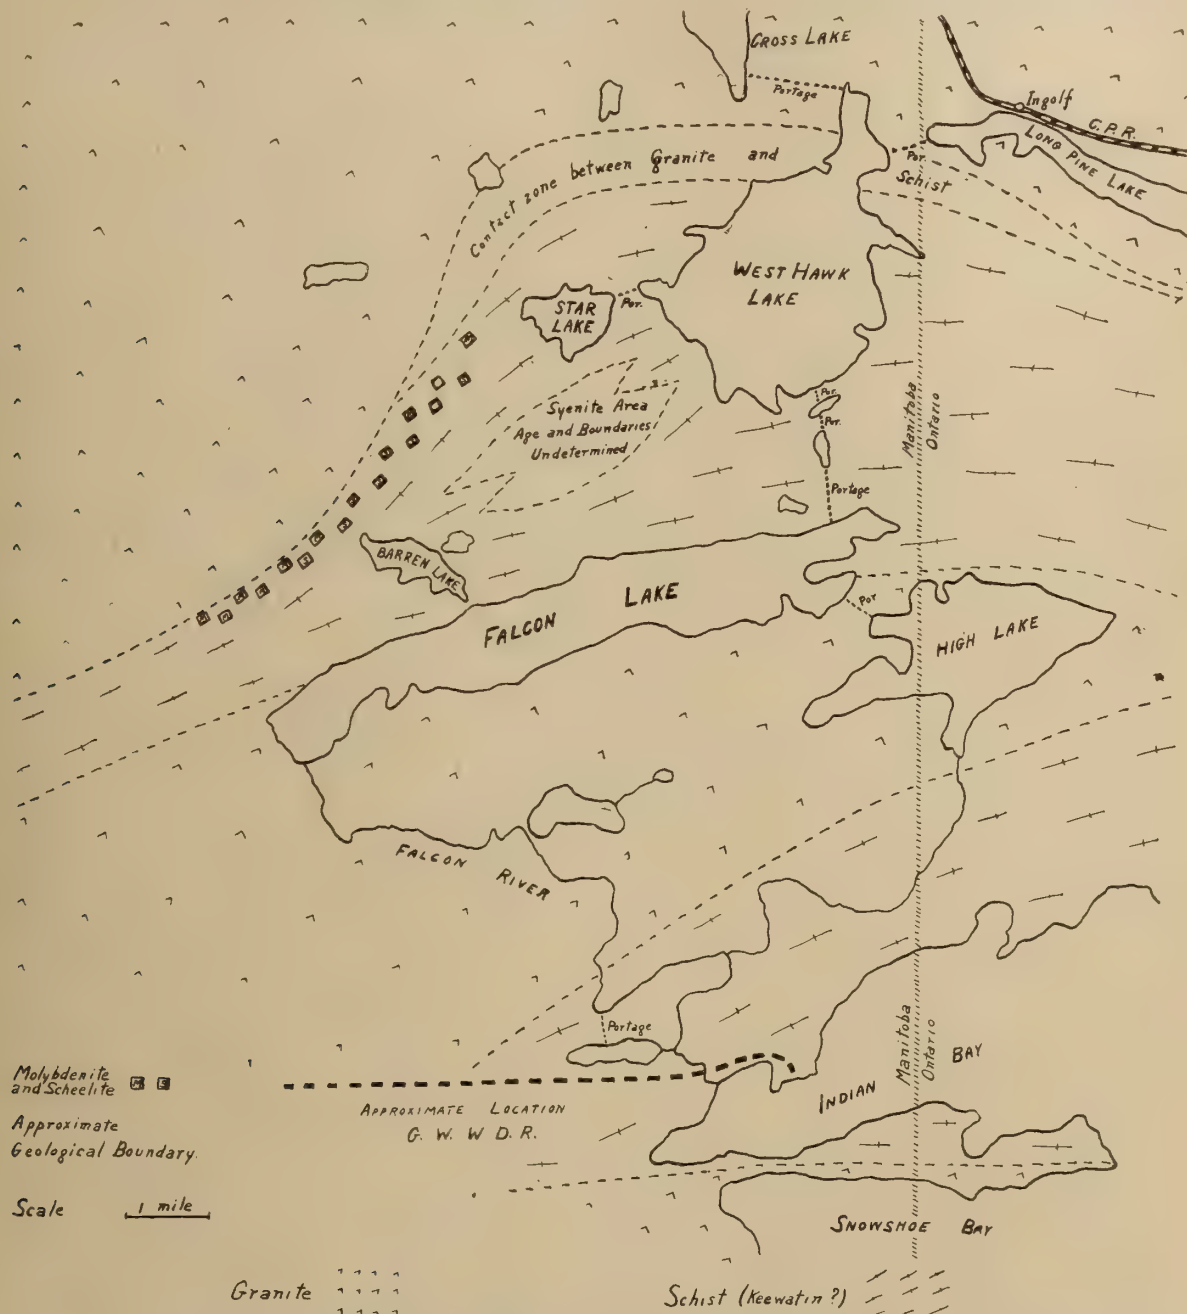

intrusive granite series. The schists have evidently been derived by processes of compression, shearing and granite-intrusion from basic lavas and intrusives together with some sediments and small amounts of acid igneous rocks. The schists appear as belts between areas of intrusive granite and the schistose layers are vertical, or nearly so, and parallel to the granite walls on the boundaries. The belt of schist containing the molybdenite and scheelite deposits appears to be an old synclinal trough, a residual part of formations which probably covered the granite throughout the area in former times.

It is difficult at the present time to form any con-

*J. S. DeLury, Can. Min. Journal, Dec. 1, 1917.

ception as to the depth of the schist in this trough; but from their extent and position it is reasonable to assume a considerable depth in most places. The granite in most cases shows an almost vertical wall against the schists. In parts the contact shows a wide zone of alternating wide bands of schist and granite;

and stringers in the schist. The more prominent of these minerals in connection with the scheelite deposits are epidote and garnet. Molybdenite was seen in several places in stringers in the schist near to, but not directly associated with, the scheelite. Several other contact minerals were noticed, but there has

Sketch Map of Falcon Lake District, Manitoba, showing molybdenum-tungsten areas, April, 1918.
Compiled from various maps and private notes

this type grades to another in which a rather sharp contact appears.

The typical granite is coarse-grained with large, reddish-weathering feldspars embedded in a finer-grained matrix of quartz with a small amount of mica. In places are signs of a finer-grained contact granite, and near the contact generally appears a rough, gneissoid banding, which is probably due to flowing, but may be partly due to shearing after solidification.

In the later stages of granite intrusion a magmatic extract from the cooling mass of granite furnished materials for the molybdenite-bearing pegmatite dikes and for high-temperature vein deposits which carry the scheelite. Many minerals which are characteristic of high-temperature deposits were developed in veins

been insufficient time to determine them exactly; some of them suggest feldspar, zoisite and scapolite. There is little evidence so far of the mineralizers commonly associated with granitic intrusions, such as boron and fluorine. Sulphur is present in close but not intimate relation with the scheelite; appearing in small quantities of pyrrhotite.

Other types of ore are found in the District, usually farther from the contact than are the scheelite and molybdenite. Their connection with the same intrusion of granite has not been established, and is not suggested. Free gold has been found in several quartz stringers and silicified rock bands which usually contain some of the common sulphides. Some of the sulphides commonly noted in the area are: pyrite,

pyrrhotite, chalcopryrite, arsenopyrite, sphalerite and galena. Some veins of magnetite two to four feet in width and carrying varying quantities of pyrite and chalcopryrite were also seen.

Mode of Occurrence of the Tungsten Ore.

The manner of occurrence of the scheelite orebodies is best brought out by the accompanying sketches. Very little work has been done; there has been no stripping and only one deposit has been opened at the surface. Indications are that the zones which carry the scheelite will be fairly continuous, some of them probably for several hundreds of feet, though tungsten values may not be persistent throughout the length of the zone. Good ore was seen on some of the more persistent zones at several points. To get an accurate idea of continuity of values, blasting of the rock is necessary, since the scheelite has undoubtedly weathered from the immediate surface and from those places which are loose enough to be attacked by a prospector's pick.

Surface plan illustrating nature of outcrops.

Vertical section illustrating manner of occurrence of ore.

The one deposit which was opened gave very encouraging indications for the others. Ore occurs in a zone of from three to five feet in width. The epidote-scheelite ore occupies in places roughly a quarter and in others a half of the zone mass; the ore would have values commonly corresponding to from five to fifteen per cent. scheelite. This body is lenticular in shape and is made up of a reticulated mass of stringers which have resulted from replacement of the country rock or of some previously deposited vein-material along fractures and fissures. This lens, about twenty-five feet long, passes into stringers at each end and under heavy overburden so that unfortunately in this one case where the vein has been opened, the vein cannot be traced until stripping has been done. However, as most of the other outcrops are in readily traceable zones, chances are good that this excellent showing will be traced and will show values elsewhere. If the depth of this lens is commensurate with its length, at least one carload of shipping ore should be obtained.

In most of the deposits so far found, epidote is the characteristic gangue mineral. It shows various shades of green color and occurs as granular masses and as aggregates of large crystals. The interspaces between the crystals are occupied by irregular masses of scheel-

ite which vary in size from quite small grains to masses up to an inch in length; some plates are also found apparently filling cracks, many of them showing rough faces with an area of several square inches. The scheelite is typically pure white in color, but is occasionally found with other tints, most commonly a pale pink or red. In the more northerly of the prospects, garnet appears to be a more important gangue mineral than epidote, though even here some epidote was noticed in most cases. The ore in these prospects is typically a mass of fine-grained deep red or brown garnets with small grains of scheelite interspersed between them. None of these garnet-bearing deposits have been opened, so that an idea of values cannot be given. Some rich samples were chipped off close to the surface. In all cases the scheelite was in small grains.

Ore in Band in Schist Parallel Granite Contact.

The finds of tungsten so far made are confined to a band in the schist running parallel to the granite contact. The band is about three miles in length and about a half-mile in width. While practically all of this belt has been staked, there is no apparent reason why the tungsten-bearing area should not have greater limits and further prospecting is apt to prove a wider field. It might be recalled here that very little prospecting has been done in this district and up to a late date new finds were being made. Five or six distinct discoveries have been made and tungsten tests have been obtained from several other points within the belt.

Bright Prospects as a Tungsten Field.

Prospects are bright that a small production will result from the development of known bodies; in fact, with proper care, production should pay for prospecting. The district is fortunately situated and considering the extensive showings which have resulted from a very small amount of work, indications are promising for a new Canadian tungsten field.

Development of Molybdenite Properties is Also Promising.

This paper would be incomplete without some mention of the molybdenite deposits near Falcon Lake and belonging to the same belt. Recent development has been very encouraging. Two men working for three days under adverse conditions and breaking in from the surface bagged at least seventy-five pounds of pure molybdenite. One solid mass of the mineral was estimated from measurements to weigh at least twenty pounds. From the showings in this area there appears to be no reason why Manitoba should not soon take its place as an important producer of molybdenite.

The Whitehorse Weekly Star recently printed the following information concerning one of the mines in Whitehorse copper camp, in Southern Yukon: The body of rich ore struck recently in the Copper King mine continues to grow in importance. With depth the ore body has steadily widened until now there is a 5-foot lead of copper glance and bornite which assays from 40 to 60 per cent. copper and 13 oz. silver to the ton. Manager Whitney is having hauled to Whitehorse and loaded on railway cars a quantity of this high grade ore and this will shortly be shipped to an outside smelting works.

Mr. T. Regnall, formerly manager of the Dome Lake Mining Company is now on the staff of the Hollinger Consolidated. Mr. Regnall was succeeded by Mr. Douglas Mutch.

THE ROSS BOX PUMP

The Ross Box Pump, for which patents have been granted, is an entirely new departure in centrifugal pump construction, and will be welcomed by the engineering profession. By the courtesy of the makers we are enabled to show our readers some interesting photographs and illustrations of this pump.

In this pump all cored suction passages and intricate castings disappear. The inventor has reduced the centrifugal pump to its simplest elements.

There are three principal elements in a centrifugal pump—the impeller, the pressure case round the impeller, and the suction box—and when these three elements are made in their simple form and placed in

The centrifugal pump is now the most widely used type of machine for dealing with mixtures of solids and liquids, and it has almost entirely supplanted the tailings wheel, bucket elevator, etc., for this work. For the hard service involved, the ordinary centrifugal pump, lined inside with wear-resisting metal, was developed; the main casing of the pump being sectionalized to provide more or less easy access to the lining. On account of the difficulty of fitting liners into a well-designed volute casing, only the crudest form of single suction centrifugal pump has been found practicable up to the present. The efficiencies attained are very low and there is present the inherent disadvantages of end-thrust. Attempts to develop the balanced double suction type for this service have hitherto been unsuccessful on account of the complexity of the

The Ross Box Pump.

a certain relation to each other, we have the new pump. The impeller and pressure case occupy a position in the centre of the suction box and are entirely submerged or surrounded by the liquid being pumped.

A glance at Plate 1 will show the simplicity of the machine thus achieved and a little reflection will show the pump designer the great possibilities opened up to him by the new construction. He will see that he can go ahead to maximum efficiency of impeller and pressure volute without worrying about what will happen to suction passages, main case, and glands. If he encounters special conditions of service, he can proceed to alter his impeller and volute patterns to suit. If the pump is required to handle clear water he instructs his founder to make these two elements of the usual cast iron with close clearances. If the pump is required to handle gritty water, slimes or sands, he instructs his founder to make these parts of chilled iron or steel, and tells his machinist to grind the necessary clearances. The pulp or fluid in the suction box moves at a very slow speed and experience has shown that practically no wear takes place inside it, even when very thick granular material is being dealt with.

When handling pulp it is necessary to run clean water into the glands. Pipe connections are provided for this purpose, leading to the water seal rings in the stuffing boxes. Special care has been taken in the design to prevent these water seal rings from being pushed beyond the water supply apertures. A special test pipe and valve are also provided to show that water is actually flowing to the water seal.

liners involved. In the Ross Box Pump these difficulties have been overcome, and by means which may be summarized as follows:

- (1) Complexity of parts has been overcome by placing the impeller and wearing parts in the centre of a suction box, instead of the usual practice of making a complete pump casing and then lining it. The suction box thus takes the place of the main pump casing in the usual centrifugal pump.
- (2) End thrust is obviated in the Ross Box Pump since the impeller is of the balanced double suction type. With this type of pump it is equally easy to make the impeller single or double suction.
- (3) The arrangement of the Ross Box Pump allows the designer complete freedom to secure maximum efficiency at all points. Efficiencies equal to the best type of water pump are attainable without sacrificing simplicity of parts.
- (4) The interior parts are simpler and more accessible than any single suction lined pump yet developed. It is necessary to open one door only, when every wearing part is immediately and easily available, and all this is done without disturbing the suction and delivery piping. There is no other pump for which this can be claimed.

A consideration of the foregoing will show the engineer that this new type of pump combines simple and strong construction with minimum weight and simple machine work. He will also appreciate the final degree of excellence in the disposition of the shaft bearings a feature directly attributable to the new construction. As a pump which will deal equally well with water as well as sand and slime pulp, its

application as a standard all-service pump will make a strong appeal to pump users.

In these days of standardization, it is interesting to note how far this has been done in the case of the Ross Box Pump. In view of the fact that manufacturing should be done at various centres and the necessity of making parts interchangeable, each detail drawing was made the subject of a special study.

All duplicated and non-essential dimensions were rigorously excluded and letters A B C, etc., were then substituted for the dimensions. The part in question was then drawn out full size for all sizes of pump and key dimension lists corresponding with the letters were obtained. Thus one drawing with the key dimension lists takes care of that particular part for all sizes of pump. In all, there are ten drawings 12 in. by 24 in. having eight keys each. A reproduction of one of the drawings is shown.

Further particulars regarding this remarkable line of Pumps may be obtained from The Ross Engineering Company, 908 Eastern Townships Bank Building, St. James Street, Montreal.

WILL DISCONTINUE MINING GOLD ORE.

A very significant notice was issued recently by the Canadian Consolidated Mining & Smelting Co. to its employees. It follows:

"Large increases in the various items entering into the mining and smelting of the Rossland (B.C.) ores, such as wages, cost of explosives, coke, steel, general mine and smelter supplies, without adequate compensation in values by way of increased metal prices, coupled with increased taxation, has made it necessary for the company to suspend shipments from the Rossland (B.C.) mines indefinitely.

"An endeavor will be made to keep a small force on development work, and to place the remainder of our Rossland employees at the smelter, the Sullivan mine, Kimberley, and other lead-silver properties of the company."

The explanation of the above is found in the fact that Rossland ores contain but a few pounds of copper to the ton, its values being mostly in gold. It is the intention, therefore, to make shipments just sufficient, with the augmentation of customs ore, to keep one copper furnace at the company's smelter in Trail B.C. in operation. One of the company's officials put it very succinctly when he said:

"As a gold dollar will hardly buy half as much as before the war, there appears to be no great advantage in mining gold ores at this time—especially when almost every variety of mining cost has doubled and more."

POTASH.

During 1917 there was produced and marketed in the United States 126,577 potash products containing 32,366 tons or 26.4% of potash. The average selling price was \$4.26 a unit or \$4.26 a ton for each one per cent. K₂O in the material.

British Columbia Offers Bounty for Iron

"The Iron Bounties Act," which binds the Province of British Columbia to give a bounty of \$3 per ton on all pig-iron manufactured from British Columbia ore in British Columbia and \$1.50 per ton on all pig-iron manufactured in British Columbia from foreign ore, is easily the most important mining legislation passed at the recent session of the Provincial Legislature. It went through the House without difficulty, the consensus of opinion being that it was good policy and a very opportune move on the part of the Government to encourage the development of the latent and admittedly large deposits of iron of the Province.

Another section of this Act anticipates the employment of electric furnaces in the treatment of British Columbia ores, and provides for the bonusing, on the same basis, of the output of such plants. It reads:

"Bounty, as on pig-iron under this Act, may be paid upon the molten iron from ore which, in the electric furnace, Bessemer or other furnace enters into the manufacture of steel by the process employed in such furnace; the weight of such iron to be ascertained from the weight of the steel so manufactured."

It is interesting to note here that the Government has decided to retain an expert to make an examination of the iron ores of British Columbia and submit a report on the practicality of handling it by the use of electric furnaces. Hon. Wm. Sloan, Minister of Mines, addressing the Legislature in support of the "Iron Bounties Act," said in this connection:

"I may say that, with the development of the iron and steel industry throughout the world, development which has been more marked in recent years because of the pressure brought to bear by the war, new processes have been discovered and proved through experiments, which make it practical and a commercial proposition to handle the magnetites of British Columbia without the admixture of hematite. I may add that the Government is fully alive to the importance of this from the standpoint of the industry in this Province, and has engaged an Eastern Canadian expert to visit British Columbia at an early date for the purpose of making inquiry and submitting a report on the practicability of treating our ores by means of the processes to which I have referred. I am confident that his investigations will be of the utmost value to all British Columbians interested in the establishment of this important basic industry in Western Canada."

The Minister, referring to the tonnage of iron ore available, said:

"I may say that in considering this question I have had prepared for my information a number of reports by various experts on our iron resources and now I think is the proper time to refer to them. One engineer opens his statement thus: 'In attempting to give any description or idea of the iron ore deposits of the Coast of British Columbia one is immediately confronted with the fact that, almost without question, none of the known deposits has been worked other than superficially and few have received any further development than very shallow open-cuts, tunnels or shafts.'

"He then goes on to point out that it is estimated for Vancouver and Texada Islands alone, the actual and probable ore totals over 5,000,000 tons, which would be sufficient, if we take the requirements of a blast furnace as being 200,000 tons of ore a year (equivalent

to about 100,000 tons of pig iron) to supply the requirements necessary for twenty-five years.

"Another engineer gives a rough estimate of the tonnage of magnetite iron ore on the southern British Columbia coast as far as he has examined as follows:

	Tons.
Actual Ore	630,000
Probable ore	6,050,000
Possible ore	10,500,000

"To these figures he adds the following statement: 'This would undoubtedly be largely increased by further prospecting.'"

Of the quality of the British Columbia iron ore Hon. Mr. Sloan spoke very optimistically, saying in part:

"The ores referred to as on the Coast Islands are exclusively magnetite iron ore. Those magnetite deposits are always replacements of limestone and are found in or near limestone deposits and the ores are apt to carry some lime as gangue matter, rather an advantage from an iron smelter's point of view. The iron content of these ores will run from 50 to 65 per cent. iron on commercial samples; the sample of a 600 ton lot of ore from Texada Island is given in the tenth census of the United States as having run 65.7 per cent. iron. Of course many of the deposits are not as free from gangue as the Texada Island deposits and parts of these deposits might require magnetic concentrating—a cheap process. It would be safe to count on two tons of average ore producing one ton of pig iron."

After dealing with the hematite and limonite deposits of the Province rather exhaustively, Hon. Mr. Sloan touched on the question of fuel, pointing out the remarkable resources of the Vancouver Island, Nicola Valley, and Crowsnest Pass Fields in respect of coal. He said that the coking qualities of the Crowsnest Pass coal had been thoroughly demonstrated and that while the product of Vancouver Island was not looked on as being as good as the former for that purpose the fact that the Granby Consolidated Mining & Smelting Co., after extensive experiment, was opening a mine on the Island, the output of which was to be treated in by-product ovens for the production of coke for use in its smelting centres at Anyox and Grand Forks, B.C., was ample proof that the Coast coal is capable of making first-class coke.

The problem of markets formed the concluding theme of the address, the Minister taking the position that, while it was not claimed that there is at the present time a market in British Columbia sufficient in size to absorb the whole product of a commercial unit of an iron blast furnace, it would be provided by the stimulation of such industries as are based on the use of iron and steel and which are essential to the economic development of the country.

The customs smelter at Ladysmith, B.C., is to be blown in on or about the 20th of June next, according to Mr. W. J. Rattle, general manager of the Ladysmith Smelter Company, who returned to the Pacific Northwest recently from New York where satisfactory financial arrangements were made for the resumption of operations. This smelter was active for a time last year, but closed down in order to permit a business re-organization and to provide for a continuous supply of ore. Both of these objects, Mr. Rattle, whose headquarters are in Seattle, says have been accomplished.

PERSONAL

Dr. H. M. Auri, for some thirty years on the Geological Survey Staff at Ottawa, has been doing war work at the British Embassy, Washington, D.C., since January, 1917. He is now "in charge of war metals and minerals" at the Embassy.

Mr. George L. Fraser, for some time an employee of the Granby Consolidated Mining and Smelting Co., has been transferred from the Company's smelting centre at Anyox, B.C., and has taken over the duties of general manager of the company's new collieries on Vancouver Island. He will have associated with him as Mine Manager, J. W. Powell, late of the Canadian Consolidated Coal Co., of Kentucky.

Mr. J. W. Montgomery, formerly mine manager of No. 7, Canadian Collieries (D) Ltd., has assumed the duties of mine manager of Nos. 5 and 6, while Mr. J. G. Quinn, formerly in charge of the two latter mines, has gone to No. 7.

Mr. Alex. Sharp has been appointed mine manager of the Colman Collieries, Princeton, B.C., which have been re-opened. It is understood that considerable development work is to be undertaken.

The Canadian Collieries (D) Ltd., has opened its No. 5 Mine, and Mr. D. Morton has been appointed Overman. He was Head Overman at No. 4 Mine, Extension, which has been closed down.

In the re-organization of the Fleming-Merritt Collieries, under the firm name of The Fleming Coal Company, Mr. Joseph Graham has been appointed general manager; Mr. A. E. Smith, mine manager; and Mr. John Brown, Overman. These mines, under the Inland Coal and Coke Co., have produced as high as 15,000 tons a month. The new company is taking hold vigorously, as is shown by the fact that last month, although the work may be said to have just started, 4,000 tons was produced.

Mr. A. R. Webster, formerly of the Northern Ontario Light & Power Company, has been appointed an Inspector of Mines for the Ontario Government. Mr. Webster will devote his time principally to inspection of electrical equipment at the mines throughout the whole province. His headquarters will be in Toronto.

Lieut. H. Smeddle of the 15th battalion tank corps has been promoted to Captain.

Dr. W. G. Miller, Provincial Geologist of Ontario, who is to represent Canada on the advisory board of the Imperial Mineral Resources Bureau sailed for England on May 17.

Mr. E. R. Bush of New York was in Toronto last week on his way north.

The Ontario Bureau of Mines will geologically map an area of several townships near Lake Abitibi this summer. C. W. Knight, A. G. Burrows and P. E. Hopkins of the staff of the Bureau and A. L. Parsons of the University of Toronto, mineralogy department, will all work in this area.

At the Annual Convention of National Association of Manufacturers, New York, May 20-22, H. E. T. Haultain will speak on "Restoring disabled soldiers and sailors to industry." Prof. Haultain is vocational officer for Ontario.

The Dominion Forgings & Steel Co., Hamilton, Ont., has received a contract from the United States Government for shells amounting to \$2,500,000. It is expected that other large orders will be placed in Canada in the near future.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

Vancouver Island Coal Mining Industry is Active.

The coal industry of Vancouver Island, British Columbia, was never in a more flourishing condition than at the present time. From the East to the West of Canada has gone forth the order "more and yet more coal" and the companies of this section are speeding up to an extent only limited by their ability to obtain equipment and men. The Canadian Government has intimated that the Western Provinces this year would be expected to produce two and one half million tons more coal than in 1917, the object being to meet the local demands for fuel for industrial and domestic purposes as far as possible, if not entirely, from local supplies. Thus, it is hoped, Canada's present dependence on the United States, a condition which was very apparent last year at a time when the United States could least spare the coal, will be to some extent relieved.

With the situation as thus sketched before them the coal mine operators of Vancouver Island, no doubt in common with those of all the Western Section of the Dominion, look upon themselves as in duty bound, from the viewpoint of the best interests of the British Empire and her Allies, apart from the question of whether it is or is not good business, to do their utmost to swell the monthly output. Last year there was an exceptional demand and the Island collieries, rising to the occasion, marketed 1,698,235 tons in comparison with a total for 1916 of 1,492,761. But then there was not the special application of the spur that recently has been brought to bear upon them, with the result that the first three months of 1918 finds practically every mine with returns considerably in excess of the corresponding periods of the previous year. It may be said now with assurance that, at the pace set, 1918 will find the Vancouver Island output of coal much ahead of the past twelve months, while the same may be said with confidence, although the writer has not the figures before him to substantiate it, with regard to the combined totals of the collieries of the Province of British Columbia.

Western Fuel Co. is Making Record Output.

The Western Fuel Company, one of the largest producing companies of the Island, established a record for the month of March of 70,000 tons, which is larger than that of any previous month in its fifty-year history of operation. One of its recent enterprises was the re-opening of an abandoned mine known as the Harewood. It had been standing for several years, a former management having decided that it could not be expected to pay expenses. In March the Harewood's output ran up to the useful total of 19,000 tons. This, however, is not all. The company has possession of a considerable area of coal lands in what is known as the Nanaimo Coal Field which is yet undeveloped. Coal being a national necessity under existing conditions, it has been decided to open up some of these areas and diamond drilling now is in progress with that end in view. The definite intention is to open two new mines and these, it is believed, will be producing coal before the end of 1918.

Canadian Collieries Ltd., is Extending Operations.

The Canadian Collieries (Dunsmuir) Ltd., is another company which is nicely engaged in the extension of its operations. It is opening a new mine on the Douglas seam at South Wellington, a well-known coal mining centre of the Island. Three parallel slopes are being

driven to tap this area. A good substantial tippie is being built and a modern screening and cleaning plant is being installed. A large power house has been erected which contains three return tubular boilers of good steaming capacity. Compressors and dynamos for furnishing power for the mine have been installed. There are being laid out extensive sidings and yard room which will be connected with the Esquimalt & Nanaimo Railway by a short spur. This will enable the coal to be shipped over the E. & N. to the company's wharves at Ladysmith, B.C., where it may be distributed overseas to the local or foreign markets. Before the end of the year this mine should be one of the Island's large producers.

The New Granby Coal Mine and Coking Plant.

About three miles south of the above mine, between Ladysmith and Nanaimo, B.C., is the centre of another new and important development of the coal mining industry of Vancouver Island. Here the Granby Consolidated Mining, Smelting and Power Co., Ltd., has secured, at an outlay of approximately \$750,000, a considerable block of coal lands. The opening of a new mine, the installation of the necessary plant for the handling of the coal, the erection of buildings for the accommodation of employees, and the construction of wharves, etc., at a seaboard point known as Cassidy's Landing will involve a further expenditure of at least \$500,000. This work is in progress, in fact has made considerable headway. The company's plans, however, do not stop at this, it being proposed to install at Anyox, B.C., the company's mining and smelting centre on the coast of the mainland of British Columbia, a by-product coke-making plant at a estimated cost of \$1,500,000. This will make it possible for the company to mine its own coal, transport it to Anyox for treatment, and thus secure the coke needed for the smelting of its large copper deposits.

In the opening of its new coal mine the company is driving three slopes; one of which is to be used as a main haulage way, another for ventilation, and the third for a mainway. A large acreage has been cleared, graded and surveyed into lots for building houses while a spur has been constructed from the E. & N. Railway into the mine site, while sidings and yards are being laid out and a sawmill is being installed to cut timber for the company's use.

It may be said, with respect to this enterprise, one of the most notable in connection with the coal industry in Western Canada for years, that it has been brought about largely because of the determination of the company to be as independent and as self sustaining in its operations as possible. It is easily the greatest producer of copper in British Columbia, the total production for the Province in 1917 being, roughly, 59,000,000 lbs., to which the Granby Company's contribution was, also in rough figures, 34,500,000 lbs. In 1916, however, its output was 45,631,600 lbs. The decrease is accounted for by the fact that last year, owing to the explosion at the Fernie Coal Mines, Coal Creek, and the ensuing strike, there was a period during which the usual source of coke was unavailable. With these facts in mind the chief object which the management of the company has in mind in its present programme is apparent.

Incidentally at present, but a factor which may enter very largely into the Granby Company's activities in the future, are the possibilities of the by-product ovens and the recovery of those elements of the coal the importance of which have been so strongly emphasized as a result of the disorganization of the old

commercial order by the war. Into this branch of industry the company proposes entering very thoroughly and it is confidently believed that the outcome will be the development in Western Canada of a number of profitable subsidiary industries.

The Granby's Company's coal mine, at the present rate of development, should be prominently on the list of producers before the end of the year.

Supplementing my recent account of the marked activity of the Vancouver Island Collieries, of Vancouver Island, B.C., it is gratifying to be able to report that much the same condition prevails in other coal mining districts of the Province.

In the Nicola-Princeton District the output up to the end of February, in comparison with the same period last year, showed an improvement of 20,000 tons. Two collieries have been opened up again which had been closed for a considerable period. The Island Coal and Coke Company has been re-organized under the name of the Fleming Coal Co., and its mines, at Merritt, B.C., have resumed operations after a suspension which dates back to the middle of the month of March, 1917. The Coalmont Colliery has been reopened after a period of idleness extending from the early part of 1915. The Middlesboro Collieries are the largest producers in this district, being engaged in the operation of three mines. The Princeton Collieries rank second in production, but will have a keen rival for second place during the coming months in The Fleming Coal Co.

Since the taking over of control by the Dominion Government of the collieries of what is known as District 18 by the United Mine Workers of America, the mines of the Crow's Nest Field, B.C., which come within that section, have been making a very good showing. The production thus far this year is considerably greater than that for the first two months of 1917, the tonnage produced by these mines for January and February, 1917, being 94,295 tons, while for the same period this year it reached 135,986 tons, an increase of 41,691 tons. It is reported that satisfactory progress had been made in cleaning up the mines, which were wrecked by "bumps" and explosion last April, and these mines soon will be active producers again.

Amendments to B. C. Mining Acts.

Three amending Acts, directly in the interests of men working in and around mines or smelters, were passed at the recent session of the British Columbia Legislature. These are entitled, "An Act to Amend the Labor Regulation Act," "An Act to Amend the Metalliferous Mines Inspection Act," and "An Act to Amend the Coal Mines Regulation Act." The former provides for an eight hour working day for all men employed "in, or about any coke-oven, smelter, concentrator, or mineral separation plant." The chief amendment to the Metalliferous Mines Inspection Act is that providing for an eight-hour working day to those employed underground, whose working day will start when they leave the surface and end when they reach it again, as well as those employed on the surface. These two Acts will become effective on the 31st of March, 1919. The amendment to the Coal Mines Regulation Act gives the surface workers at coal mines the eight-hour working day from the 31st of March of next year. New legislation also stipulates that inspectors of metal mines, after making their inspection, shall post the result thereof in some prominent place outside the workings in order that the miners may be kept in touch with the conditions under which they

are working. Another provision is that "every drill used in stoping in any mine where the character of the ground is such that dust is caused" by the work shall be equipped with a water spray.

ONTARIO.

Assessment Work.

Definite assurance has been given by the Ontario mines department that prospectors will not be compelled to perform two periods of assessment work on their claims in one year. Where two periods of work accrue due in one year, the second period will be extended one year. It should be thoroughly understood, however, that there will be no general extension similar to that of last year. An Order-in-Council will be passed in the near future making it compulsory for all claim holders to do one period of assessment work this year. This will insure activity in the prospective mining field without the imposition of an unusual burden.

Adanac.

Further shearing has been encountered in the north crosscut at the 130-ft. level of the Adanac, and the face of the crosscut has reached a point where it is daily expected the downward continuation of the large vein encountered on the surface is expected to be picked up. The shearing just encountered is about three inches in thickness and assays show low silver values. The presence of silver and cobalt stain in the shearing just encountered is taken as good indication.

Peterson Lake.

The twelfth annual report of the Peterson Lake Silver Cobalt Mining Company, Limited, covering the year ended April 30th, shows an expenditure of \$36,124, as compared with an income of \$1,330, thereby showing an operating loss of \$34,794. Cash on hand amounts to \$11,658. During the current year it is expected the assets of the company will be largely added to by the treatment of the dumps and slimes which have gathered on the property from previous operations. It is expected to have the oil flotation mill, which is now nearing completion, in operation in June on the treatment of the slimes in the Seneca-Superior section of the property. The company also claims ownership of a large quantity of slimes now in dispute with the Dominion Reduction Company. The Dominion Reduction is understood to have appealed from the ruling of the court. The slimes in dispute are those deposited up to July 2nd, 1915, and according to government returns the amount is estimated at about 226,640 tons. The company estimate the silver content at 6½ ounces per ton.

Temiskaming—Hohenour.

Litigation is likely to follow any attempt on the part of the Temiskaming Mining Company to remove the mining plant from the Hohenour claims in the Kirkland Lake district, on which they have been carrying on development work, under an option agreement for the property. Recently an extension of time was granted on the option, at which time the owners of the claims contend the original agreement respecting the removal of the plant underwent a change to the effect that the plant should be left on the property. The original agreement permitted of the removal of this equipment, which was formerly used by the Temiskaming Mining company in the development of the North Thompson property at Poreupine.

Croesus.

According to recent rumors the rich Croesus mine in Munro township is soon to figure in the organization of a stock company, for the further operation of the property. Last year a 50-ton mill was installed on the Croesus, and it was intimated on every hand that a large tonnage of \$50 and \$60 ore was available for treatment. The property is privately owned and the suspension of operations a few months ago was a considerable surprise to mining men throughout the north country. The Croesus during the early days of its development yielded some of the richest gold ore ever found in the world, and in sinking the first 100 ft. of shaft something like \$100,000 in gold was taken out. While no official statement has been given out, it is understood the rich ore does not continue consistently to depth. The rich vein is also said to have faulted and its continuation has so far not been re-located. These facts tend to strengthen the report that a joint stock company is being formed.

Patricia Mill Nearly Complete.

It is expected the new 50 ton mill of the Patricia Syndicate at Boston Creek will be in operation by the first of June. The record of this property during the past seven months has been a wonderful one. The first ground was broken on the Patricia late last fall. In the meantime a mining plant has been installed, a large set of camp buildings erected, and the underground workings carried to a depth of 200 ft. While the vein is not wide compared with those of Porcupine and Kirkland Lake, the grade of the ore is such as to permit of selective mining, from which it is expected a substantial profit will be derived. Mr. Charles O'Connell, formerly manager of the Tough-Oakes Mine at Kirkland Lake, is in charge of the property. The results of the first mill run will be awaited with a good deal of interest by those holding claims in the Boston Creek district.

Rich Ore at Burnside Mine.

Some of the richest ore ever encountered in the North Country is in evidence at the Burnside property at the point where the vein was encountered in the crosscut at a depth of 125 feet. A pay streak carrying visible gold about seven inches in width occurs in a five foot vein, the whole of which is of a commercial grade. The dip of the vein at the present point is to the north, but like those on its neighbor, the Tough-Oakes, it is expected to change to the south when depth is reached. It has been reported recently that there is a move on foot for the amalgamation of the Burnside and the Sylvanite properties. The Burnside is controlled by the Aladdin-Cobalt Mining Company, and is at present using the electric plant of the Sylvanite company in its development operations.

Kerr Lake.

During the month of April production at the Kerr Lake Mine was maintained at two hundred and one thousand ounces. This compares with 207,000 produced during the month of March. Only once during the past sixteen months has the production of the mine fallen below 200,000 when in July of last year 189,392 ounces were produced. This is at the rate of about 7,000 ounces every twenty-four hours. This output at the present price of silver works out at a profit of about \$150,000 monthly or approximately \$1,800,000 per annum.

Ontario-Kirkland.

The Ontario-Kirkland Mining company plans to resume operations about the middle of June. The development work previously done on the property has shown up several veins which are large and contain very encouraging gold assays. The company controls what were formerly known as the Hurd claims. A shaft has been driven to a depth of about 100 feet and considerable prospecting work has been done.

Installing Plant at Molybdenite Property.

About forty tons of equipment has been shipped to the Indian Peninsula Mining company property near Amos on the Transcontinental railway. The company propose installing a 100-ton oil flotation mill for the treatment of molybdenite ore and it is expected that within the next few weeks a portion of the equipment will be in operation. Tests, made in the laboratory of the Groch Centrifugal Flotation Limited at Cobalt, have demonstrated that a high recovery can be made, by the oil process in the treatment of molybdenite ore.

According to recent reports it is understood the Three Nations Mining Company's property in the Township of Whitney, Porcupine District, may be re-opened at an early date. It was at one time rumored that this property and the old La Palme, both of which were considered to be excellent prospects in the early days of the camp, would be amalgamated. However, until the present time both properties have remained separate.

Shipping Ore From Keeley Mine.

Shipments of ore are being made regularly from the Keeley Mine in the South Lorraine section of the Cobalt district. It is estimated that there are perhaps a quarter of a million ounces of ore in sight. A limited amount of this ore is high grade and is being shipped by the wagon road to Silver Centre, from which point it is taken to the railway at Haileybury, from where it is shipped to the smelter for treatment. The balance of the ore is low grade and is not available at the present time owing to the fact that underground work has not yet been started. It is expected, however, that the pumping out of the mine will be commenced in the immediate future. The property has been connected up with the Matabiechewan power line of the Northern Ontario Light and Power Co.

New Plant at McKinley.

The new flotation equipment at the McKinley-Darragh was tried out last week and is being gradually brought up to capacity. Within a short time it is expected the plant will be brought up to a capacity of 200-tons per day. According to recent reports the costs at the McKinley-Darragh are being kept considerably below that of last year. This is partly due to the erection of the new oil flotation plant. A big item in last year's expense account was the connecting up of the main shaft with the lower workings of the mine.

Treating West Dome Ore at Dome Lake Mill.

The treating of ore from the West Dome property has commenced in the Dome Lake mill. According to the present arrangement a test run of 1,000 tons will be put through. Whether the company intends to continue the use of the Dome Lake Mill or not, has not been made known. It is understood the capacity of the

Dome Lake mill is more than sufficient for that company's ore, and such a scheme would appear to be feasible.

Doherty Prospectors Want Recording Office Changed.

Prospectors and mining men interested in the Doherty district at Doherty Siding on the T. & N. O. south of Temagami, are petitioning the Mines Department for the location of a more convenient place of recording than at present. Under the arrangement now ruling recording and other official business is transacted in Toronto. It is thought this could be more conveniently done at Haileybury.

Temiskaming.

Operations in the mill at the Temiskaming Mine have been suspended for the time being. However, underground development work will be continued more aggressively than ever. The amount of ore at present available was not sufficient to keep the mill running to capacity and the hoisting of ore was interfering to a certain extent with the efficiency of underground work, thus the management believe that with the extra speeding up of underground work sufficient ore will soon be developed to keep the mill running at capacity. In the meantime, advantage will be taken of the shutdown in this department to make much needed repairs to the plant.

Encouraging results are being met with in underground work at a number of points and it is possible much new ore will be developed. The main underground work is being prosecuted at the 700 ft. and 1,600 ft. level and results are said to be very encouraging.

Tough-Oakes.

Work at the Tough-Oakes Mines is understood to be resulting favorably. Interests closely identified with the directorate of the company have intimated that a substantial profit is now being made. In addition to wiping out the deficit of last year, it is expected a substantial profit will be shown on this year's operations.

Tech-Hughes.

During the month of April the tonnage treated at the Tech-Hughes mill at Kirkland Lake was in the neighborhood of 1,969 tons. The gross gold content for the month averaged about \$5.86 per ton, which is lower than usual. It is the policy of the Tech-Hughes management to draw all the mill rock from development work. Later on when selective mining is undertaken it is expected a substantial profit will be shown over operating costs.

Nipissing.

For the month of April the Nipissing Mining Company's production was at the rate of not far under \$11,000 per day. The company mined ore of an estimated value of \$329,617 and shipped bullion and residue of an estimated net value of \$308,736. Several small veins of promise were encountered in shaft 73. The high grade mill treated 210 tons and shipped 296,453 fine ounces of silver. The low grade mill treated 7,623 tons. This is the highest month's production of Nipissing during the current year and was only exceeded once during the year 1917, when in September last 349,258 ounces of silver were produced.

Your Mine Production Must Be Continuous

Maximum, top-notch coal production, continuously assured and nothing less, is the program that will help Canada and our allies achieve victory. Don't take chances with costly, time-delaying machinery breakdowns. Play safe by providing your repair shop with

IMPERIAL WELDING EQUIPMENT
OXY-ACETYLENE--OXY-HYDROGEN

Your blacksmiths can easily and quickly repair the most complicated breaks with an Imperial Outfit, which supersedes expensive, out-of-date riveting and bolting repair methods. It often pays for itself through a single operation.

Welds everything in metal and cuts all wrought iron or steel. Imperial Equipment is first in Safety, Speed, Economy and Efficiency. Portable and always ready for instant use.

Prest-O-Lite

PROCESS

Oxy-Acetylene Welding and Cutting Effects Important Savings Wherever Machinery is Used

HERE is information of vital importance to every Canadian who realizes that conservation is a matter of national necessity. The nation's scrap-pile is conservation's worst enemy. Hundreds of thousands of dollars' worth of valuable castings, machine parts and tools, are annually saved from the scrap piles of Canadian Railways, Steamship Companies, Mines, Factories, Machine Shops and Public Utilities Corporations by the Prest-O-Lite Process of Oxy-Acetylene Welding. All kinds of metals are welded by the Prest-O-Lite Process, which actually fuses two pieces of metal into one by the intense heat of a relatively small and easily controlled flame.

In almost every branch of human endeavour, where metal or machinery is produced, shaped, moulded, built or used, this process has proved itself to be a great economic factor and veritable revelation in cost-reducing and money-saving. The conservation of time and materials—so necessary to the COUNTRY'S business and *your* business—is *our* business.

The following Representative Manufacturers, Utilities and Transportation Companies, are Using Prest-O-Lite Welding and Cutting Equipment, and Prest-O-Lite Dissolved Acetylene Exclusively, in Their Welding and Cutting Operations

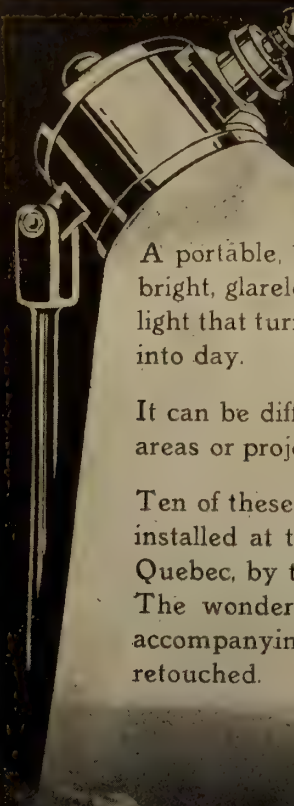

Canadian Pacific Railway, all points.

ELECTRIC DAYLIGHT

WITH THE Northern Electric DAVIS FLOOD LAMP

A portable,
bright, glareless
light that turns night
into day.

It can be diffused over large
areas or projected in a solid beam.

Ten of these Flood Lamps were recently
installed at the "King's Pit," Thetford Mines,
Quebec, by the Asbestos Corporation of Canada.
The wonderful results are truly pictured in the
accompanying night photograph which has not been
retouched.

The Light that
Lights Niagara

These Flood Lamps can be used anywhere—
no arc lamp trimming—no moving parts—no
permanent wiring.

*Write our nearest House and tell us about
your lighting problems.*

PROVINCE OF ONTARIO

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Preliminary returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$71,060,942, of which the metallic production was \$56,845,788.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

For list of publications, illustrated reports, geological maps and mining laws, apply to

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

- Fuel Testing Laboratory.**—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.
- Ore-Dressing Laboratory.**—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.
- Chemical Laboratory.**—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.
- Ceramic Laboratory.**—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.
- Structural Materials Laboratory.**—Experimental work on sands, cements and limes is also undertaken.
- Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to **The Director, Mines Branch, Department of Mines, Ottawa.**

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,

Per C. F. BUSS, Superintendent.

CXL EXPLOSIVES

All CXL. products are reliable.

Cans for thawing explosives, in stock.

Caps for blasting, No. 8 the best.

Every electric cap thoroughly tested.

Safety fuse of the best brands in stock.

Strong batteries for electric blasting.

Order anything for blasting, we have it.

Rheostats for testing batteries.

Insist on CXL. accessories.

Every aid to blasting kept in stock.

Safety with efficiency is our motto.

CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO

No. 12

THE B. GREENING WIRE CO., LIMITED
HAMILTON, CANADA

Speed up your rock drilling!

Time studies indicate serious efficiency losses in drilling rock, due to the time spent in changing steel, shifting mountings, keeping the drill and steel in line with the hole, etc.

You can reduce this idle time and increase your rock-cutting efficiency remarkably by selecting

SULLIVAN Pnufeed Rotators

The Pnufeed Rotator is a self-rotating water hammer drill mounted on an automatic air feed. Its features include:

- 1.—No crank, no feed screw—instead, forward and back air feed.
- 2.—Few mounting changes. Two holes, 18 inches apart, can be drilled without touching the arm clamp.
- 3.—Automatic alignment of drill and steel with holes.
- 4.—One-man operation throughout.
- 5.—Feed of variable strength.
- 6.—Single throttle control of drill and feed.

The Pnufeed Rotator is a practical, all-around drill. It is quickly changed from drifter to stoper, or to a hand sinker.

Ask for Bulletin 670-F.

For Shaft Sinking Use the Jackhamer Sinker

Note the Strong Features

Steel-Holder and Spring-Retained Fronthead

- All-Steel Construction
- All-Bolted Construction
- Special Hole-Blowing Device
- Special Steel Holder and Puller
- Powerful Mechanical Rotation
- Automatic Heart-Beat Lubrication
- Spring - Retained Fronthead

DDR 13-Jackhamer Sinker

The Jackhamer Sinker has been specially designed for drilling down holes of comparatively large diameter to a depth of 12 feet, and is thus particularly useful for shaft-sinking. The design is rugged, operation is simple, the steel-holder is most useful in soft material and can be swung out of use in hard rock.

Ask the nearest Branch Office for Bulletin K-205.

What Are You Doing to Increase Your Output For This Year ?

When you install a "New Cleveland" Type S Stoper, you are practically doubling the ability of one man, for it does so much more work than others.

But that isn't by any means all. "New Cleveland" Type S Stopers are so ruggedly built that they stay on the job more constantly and cost far less for repairs. They use less air and operate more smoothly than other drills. The speed and power of the blow enables the runner to break previous records.

We guarantee "New Clevelands" to give you the results in competition with other drills.

Write for Bulletin No. 35-A, which fully describes the "New Cleveland" Type S Stoper.

CARBIDE LAMPS

Float Feed

ARE REAL DIFFERENT

The chief point of difference between this lamp and others is that it automatically rakes the carbide. It does for itself what the miner has to do for other lamps, only with this difference. The ITP lamp is raked at exactly the right moment and never vigorously—result—always the correct size flame and never any blowing due to excess pressure. Write us for a sample for free test. Catalog and prices on application.

IMPERIAL WELDING AND CUTTING EQUIPMENT

OXY ACETYLENE PROCESS

Avoid Shut-Down or Delay When Emergencies Arise

The tool equipment of every mine is incomplete without an Imperial Welding Outfit. Within a few hours after the most serious break, metal parts will be inseparably joined and work continued, as a result of its use. First in Economy, Efficiency and Safety, the initial cost of an Imperial Equipment is often repaid in a single operation.

Write today for catalog, containing valuable data on cost of operation, work actually done, etc.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORÉ MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167 603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

Latest Model
No. 6 Wilfley Table

Large capacity—Clean separation—

The WILFLEY TABLE was the pioneer concentrating table and its margin of superiority over other types of concentrating machines in capacity and low cost of operation and maintenance is to-day greater than ever before.

The Wilfley engineers are backed by 20 years of experience in this field, and from this experience has been developed the Wilfley of to-day.

There are several new types of Wilfleys, each designed to meet special conditions. The WILFLEY TABLE is of great simplicity in design, yet has large capacity, and will make a clean separation. Our No. 1623 and No. 10 riffing systems have been developed to give great capacity, and clean separation in complex ores.

All Wilfleys are equipped with latest improvements, such as adjustable wash-water and feed-box, new draw-bar, improved tilting device, etc.

With every WILFLEY TABLE goes MASSCO SERVICE—the world over. No matter where your plant is situated you can get dependable products at fair prices through the Massco Giant.

Write us fully concerning conditions in your mill and our engineers will recommend the type of WILFLEY best suited to your requirements.

Wilfley Tables—Assay and Laboratory Equipment—Mine and Mill Equipment and Supplies

No sour milk this Summer

The cook who uses Klim experiences no milk troubles during the hot weather. For cooking or for table use he can always provide pure, fresh pasteurized separated milk for the whole camp. Klim, which is in powder form, won't sour, and requires no refrigeration to keep fresh. It has the natural milk taste.

Use Klim this summer—mix dry with sugar, flour, etc., for cooking, or dissolve in water for use as liquid. Bults small, convenient and economical to use, light to ship or pack, will not spoil—ideal for miners' use.

We publish in this issue a few extracts from the report of Mr. A. G. Burrows, of the staff of the Ontario Bureau of Mines, on the Metachewan gold area. At least one property in this area is to receive careful examination this summer, the Colorado-Ontario Development Company having undertaken development of the Otisse claims in Powell township. The report and map just published by the Bureau of Mines should prove very useful to those who work in the area. Mr. Burrows is an acknowledged authority on the geology of Northern Ontario gold areas.

The Munitions Resources Commission is undoubtedly doing some useful work. It may yet live down that

MINING IN EASTERN ONTARIO.

Ontario is a producer of many minerals. The Sudbury nickel-copper mines, Cobalt silver mines and Porcupine gold mines include some of the world's most notable metal mines. In this number we draw attention to a part of the Province that receives less notice from mining men, but which includes many important mineral deposits.

The most recently developed industry is that of fluorspar mining at Madoc, in Hastings County. The growing consumption in the United States some time ago created a scarcity of fluorspar in Canada. In the expectation that supplies from the United States would perhaps be entirely cut off, it was thought very advisable to develop domestic deposits. The price rose so rapidly that there was reason to expect that some of the Madoc properties might be profitably developed. Exploration during 1917 met with satisfactory results and some good deposits are being opened up.

Madoc is the centre of a prosperous farming community. It has for some time been noted also as a tale producing centre. The Henderson mine at Madoc has been a steady producer for years. The deposit is an exceptionally good one.

Eastern Ontario is to-day an important producer of tale, graphite, feldspar, pyrite, mica, lead, fluorspar, and molybdenite. The Black Donald graphite mine near Calabogie, in Renfrew County, is a large producer. The feldspar mine near Verona in Frontenac County, operated by Feldspars, Ltd., is reputed the best in America. The Lacey mine, near Sydenham, is said to be the largest mica mine on the continent. Excellent pyrite is produced near Quensboro and at Sulphide, in Hastings County.

While overshadowed by that of Northern Ontario, the mineral production of Eastern Ontario is considerable. Many of the minerals are very necessary in the manufacture of munitions and it may be expected that activity during 1918 will be marked. Shortage of labor will, of course, prevent the obtaining of desired production, but a good record will doubtless be made.

The question of smelter rates for lead-silver-zinc ores has been much discussed in British Columbia recently. In response to requests from many sources, the government has appointed a committee to investigate the matter. It is to be hoped that elucidation of the facts will result in more satisfactory relations between mine owners and smelter interests.

The bounty of two cents a pound on zinc produced in Canada should materially help the development of the electrolytic process now used in British Columbia. Zinc of very high quality is being produced; but competition with American smelters is impossible under present

ONTARIO'S NEW OIL FIELD.

During the past year there has been a notable revival of interest in oil and gas production in Ontario. The results of recent drilling in Dover township should give a great impetus to oil prospecting. It is probable that there will be more activity in Ontario oilfields this summer than has been evident for many years.

Canada's chief oil producing district is part of south-western Ontario, between Lake Huron and Lake Erie. For over half a century Lambton county has been a steady producer. The Tilbury district in Kent county, and the Onondaga district in Brant county have been prominent in recent years. Most of the oil has been obtained from the Onondaga formation, but the recent discovery in Dover township is in the Trenton limestone.

Not only is the new well a good producer; but it is an indication of what may be expected when the Trenton formation in Ontario is explored. In the Ohio-Indiana field, extending from north-western Ohio down in a south-westerly direction into Indiana, most of the oil comes from the upper part of the Trenton limestone. This horizon is geologically considerably below the horizon which has been Ontario's chief source of oil up to the present. To develop the Trenton deposits extensively it will be necessary to drill many deep wells.

Mr. Eugene Coste, one of Canada's most experienced and successful oil and gas authorities, after recently visiting the Dover fields, said in an interview to "The Globe": "We would deprecate the creation of any excitement regarding the Dover fields; but the indications are that they are permanent."

Leading economists have told us, what every producer of gold knows, that the production of gold during the war is not so profitable as the production of metals used in the manufacture of munitions. But can we afford to neglect production of the metal which the world has accepted as the standard of value? So long as the world recognizes gold as the standard, it will be desirable that the allied countries should have as large a percentage of it as possible. It would be foolish to divert energy from the production of materials necessary to carry on the war, in order to produce gold which a victorious enemy would be able to take from us; but on the other hand it seems unwise to discourage production of the metal which can be used so advantageously both during and after the war.

Canada is a country of great natural resources; but it is well to remember that these resources become valuable only when utilized. Every day that gold lies in the ground the country is losing money. It may be true that the mine-owner might profit as much or even more by delaying development until after the war, when supplies and labor may be cheaper; but that only means that the workman gets less for his labor and the manufacturer gets less for his goods, and we have denied ourselves the use of the gold. Is it not in the

best interests of the country to get our gold into circulation, as soon as possible?

DOMINION POWER BOARD.

The question of an adequate supply of fuel and power for all of Canada is one which has been brought sharply into view as a result of the acute fuel shortages during the past two winters. Certain phases of the situation demand and are receiving immediate action through the Fuel and Power Controllers and the Honorary Advisory Council for Scientific and Industrial research. The general problem of the fuel-power requirements of Canada is one that the end of the war will not solve. It is not merely a question of looking ahead for a year or two years or for whatever time the present conflict may last, but rather a matter of providing for all time to come.

Canada is recognized as one of the greatest water power and coal countries in the world. No people enjoy to a greater degree the benefit of cheap dependable hydro-electric power and none have had this benefit more universally adapted for municipal, industrial and domestic use. Canada's resources of coal are of tremendous extent, but are so located and of such a nature that special problems must be solved before they are made available to their maximum possible extent for domestic and manufacturing purposes. The future progress of the country depends very largely on the development and use of all the available fuel-power resources. To realize this, the Government has formed a Dominion Power Board comprising nine permanent officials of the various Departments who have become as a result of their regular departmental work, recognized authorities on various aspects of the fuel-power problems of the country. This Board has also been charged with the responsibility of co-ordinating all the investigation activities of the Government with regard to fuel power resources.

The Board has two main functions, (1) the collection of information, (i.e., Intelligence Service); and (2) to advise upon the development and use of fuel power resources of the country (i.e., an advisory body).

The Honorable Arthur Meighen, Minister of the Interior, is Chairman of the Board. The members are: Arthur St. Laurent, Assistant Deputy Minister, Department of Public Works. C. N. Monsarrat, Consulting Engineer of the Department of Railways and Canals. W. J. Stewart, Consulting Engineer to the Department of External Affairs regarding International waters. John Murphy, Electrical Engineer to the Dominion Railway Commission. H. G. Acres, Chief Hydraulic Engineer, Hydro-Electric Power Commission of Ontario. O. Higman, Chief Electrical Engineer, Department of Inland Revenue. D. B. Dowling, Geologist, Department of Mines. B. F. Haanel, Chief Engineer, Fuel Testing Division, Department of Mines. J. B. Challies, Chief Engineer and Superintendent, Dominion Water Power Branch, Department of the Interior.

The Bennett-Martin Asbestos and Chrome Mines Company has begun construction of a mill. The mine in Ireland township was opened a year ago and good results have been obtained on development.

At the Jacobs asbestos mine, the milling method of mining is to be used. Underground haulage will be by electric locomotives. The old method of mining, still used, is open pit. Instead of cable derricks for hoisting, a shaft will be used in the new workings.

The Matachewan Gold Area*

By A. G. Burrows.

In the fall of 1916 a discovery of gold was made on the Davidson claims in Powell township, which is on the Montreal river, in the District of Timiskaming. Powell township is near Fort Matachewan, a Hudson's Bay Company post, consequently the area has become known as the "Matachewan Gold Area." Prospecting had been carried on from time to time since the discovery, in 1906, of silver in James township, at Elk Lake. Gold was found at several places in the southeast part of Alma township and in the north central part of Cairo township, in an area of syenite, a few years previous to the discovery in Powell.

At the Davidson claims in Powell township the original discovery was native gold in an irregular mass of quartz and rusty weathered schist. In 1917 gold was found in a reddish porphyry by Sam Otisse on his own claims to the northeast of the Davidson. This prospector also discovered gold in a band of grey pyritous schist which lies to the south of the porphyry. Further work on the Davidson claims resulted in gold being found in the red porphyry which outcrops on these claims.

Since there was no detailed geological map of this area, the writer was instructed by Dr. W. G. Miller, Provincial Geologist, to make an examination of the country in the vicinity of the "finds." It was found that while a number of claims had been staked the previous winter, work was being done on only a few of these, consequently only a very small part of the new staking has been well prospected.

A geological knowledge of the area was obtained by travelling the township boundaries, traversing most of the water routes, and making sections away from the water routes. Only a few of the claim lines in the vicinity of the Davidson find were travelled, since most of the claims were very irregularly staked in the winter and difficult to follow in the thick bush in summer. However, a general examination was made of Powell, Cairo, Baden and Alma and the Matachewan Indian Reserve, while portions of the north parts of Yarrow and Kimberley also received attention.

During the season of 1917, Dr. H. C. Cooke, of the Dominion Geological Survey, examined an extensive area to the west of the Matachewan area, and his map of this country, showing the geology and canoe routes, will be of great assistance to the prospectors working westerly from the Montreal river.

The nearest railway station is Elk Lake, the terminus of a branch line of the Timiskaming and Northern Ontario railway that leaves the main line at Earleton station.

From Elk Lake there is a canoe route up the Montreal river a distance of about 30 miles to the Davidson landing. In high water in spring a gasoline boat has been utilized as far as the foot of the Long portage, with a short portage around Indian Chute. The trip by canoe alone is very arduous owing to the swift current in the Montreal river above Indian Chute. In this trip three portages are necessary. In low water during the summer all the stiff rapids above Indian Chute are usually poled or tracked. A route from Elk Lake, by way of Long Point lake, was used by various parties in 1917. This requires transportation of supplies and canoes over the Gowganda wagon road to Long Point lake, from which there is a water route down stream

by way of the East Branch of the Montreal river to the Matachewan area. Supplies for operations in 1918 were taken in (from Elk Lake railway station) over a winter road that roughly follows the Montreal river.

Rocks of the Area.

The oldest rocks of the area are of Keewatin age and consist mostly of basic to intermediate volcanics, accompanied by chert (iron formation) and schistose sedimentary rocks like quartzite and conglomerate. These have been intruded by numerous diabase and porphyritic dikes, whose age, beyond that they are younger than the Keewatin schists, is difficult to determine.

The older rocks have also been intruded by acid rocks like granite, syenite, gneiss and porphyry, which are probably of Laurentian or Algonian age. These acid rocks have also been intruded by numerous dikes of diabase, some quite fresh-looking.

A series of flat-lying sediments of the Cobalt series has been deposited on the eroded surface of the older greenstones, granites, syenite, porphyry, and some of the diabase dikes.

At only one place was a diabase dike observed intruding the Cobalt series, but a few others have been reported. This is in marked contrast to the older rocks, which are everywhere intruded by numerous dikes of diabase, consequently most of these dikes would appear to be older than the Cobalt series. In addition, at several points unconformities between the Cobalt series of sediments and diabase dikes have been noted. It would therefore seem that the conglomerate in the area would not be worth prospecting for silver, owing to the scarcity of sills and dikes of diabase of Keweenaw age.

The chief interest in the area is in its possibilities as a gold producer. For some years gold has been known to occur in Cairo and Alma townships, but it was not until the discovery on the Davidson claim in Powell in 1916 that the area attracted much attention.

Since only a small part of the area has been closely examined by the prospectors, it is possible that other promising finds will be made in the Keewatin areas in Powell and adjoining townships. The Keewatin rocks near the contact with the intrusive syenite in Cairo and Alma townships should be worthy of close examination and it is possible that other small masses of orthoclase porphyry, similar to the occurrences on the Davidson and Otisse, will be found. Prospecting is, however, rendered difficult by deposits of sand and gravel over much of the area.

Gold in Cairo and Alma Townships.

Gold was found by Jake Davidson, a prospector, in the sand-gravel stretches to the north of the Montreal river, near Fox rapids; the writer is informed by him that he frequently obtained colors in the pan, but found no place where there was any placer workable under present conditions.

Gold occurs in quartz veins in some parts of Cairo and Alma townships.

Craig Claims.—The Craig claims are situated about three miles north of Fox rapids. Here a wide quartz vein was discovered with a north and south strike. At one place trenching has shown a width of 150 feet of quartz, and silicified and brecciated syenite which is the wall rock of the vein. Part of the vein material is somewhat felsitic in appearance, suggesting some fine-grained igneous rock related to the syenite.

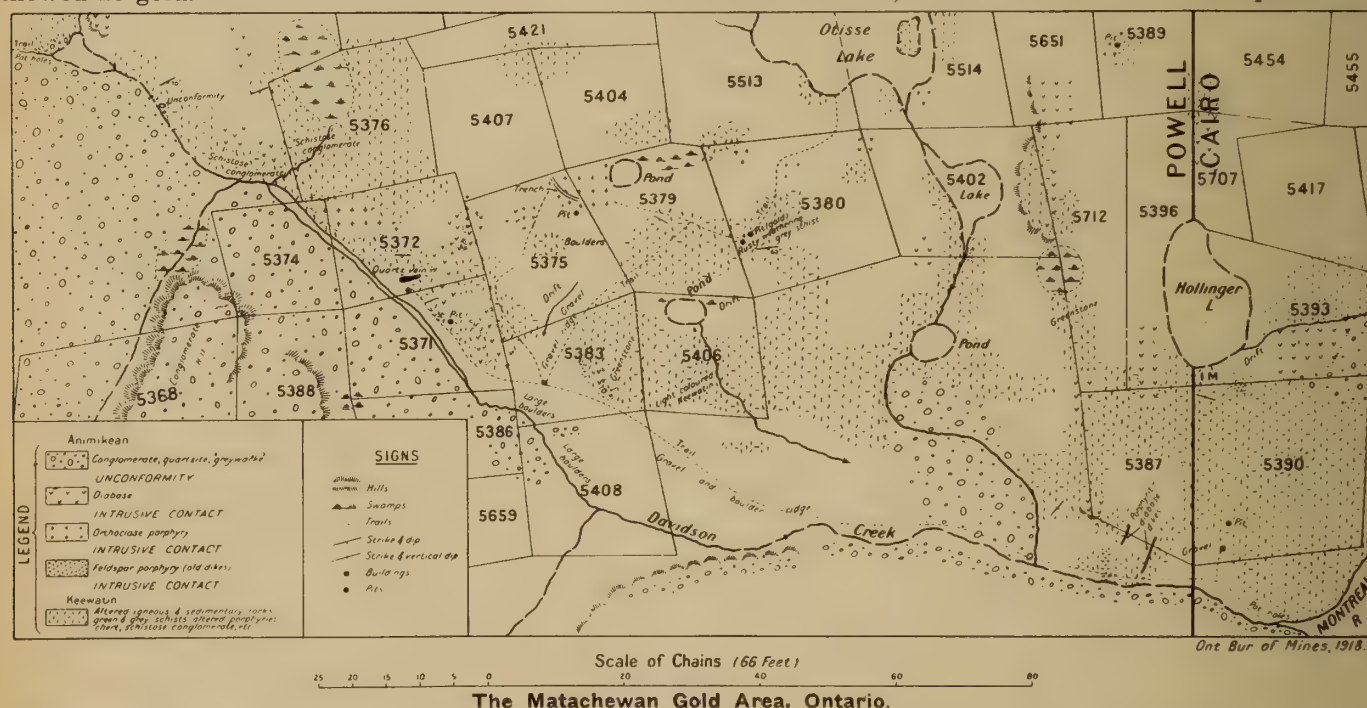

At one point a shaft has been sunk about 60 feet, with short drifts on the vein, and fine visible gold has been reported in the shaft and drifts, and in samples on the dump. No gold, however, was seen by the writer, but samples of material from the dump showed low values in gold. A little iron pyrites was observed in pieces of quartz and syenite, but generally the sulphide is in very minor quantity. The property is equipped with a small steam hoisting plant and has a good set of mine buildings.

Chief Claim.—The Chief claim (17310) is situated about 20 chains west of the two-mile post on the east boundary of Alma. A discovery of gold in a small hummock of syenite, which outcrops in a beaver meadow, was made some years ago. The vein strikes E. and W. and is quite narrow, varying in width from a mere crack to about 6 inches where exposed for 30 feet. A few shallow pits were sunk on the vein, and some samples rich in gold are reported to have been taken from the westerly pit, which was filled with water at the time of the visit. A sample of vein material from the dump, consisting of quartz, chalcopyrite, and a little galena, gave an assay of \$4.40 in gold. Attempts were made by trenching to pick up the vein on the hill to the east, but only mere stringers were found, a sample of which showed no gold.

the summer of 1917, and there were only a few prospectors in Cairo and none in Alma.

Gold in Powell Township.

Davidson Claims.—These claims are situated in Powell township about two miles west of the Montreal river. Gold was found by Jake Davidson in 1916, on the south part of claim 5372, in a mass of quartz and schist. This deposit strikes nearly east and west, and has been traced by trenching for 225 feet. It dips 60° S., is 40 feet wide at the west end and narrows toward the east. The quartz is very irregularly distributed in the schist, and for the most part the veinlets or quartz masses are transverse to the strike. The deposit very probably is lenticular in form. To the southeast there are a number of huge boulders of material from this deposit. The surface of the schist is weathered to a brown rust, largely due to the oxidation of the iron in the ankerite which forms a part of the altered rock. There is also a proportion of bright green serpentinous mineral. Gold in a state of very fine division was noted at a few places in this deposit. The only sulphide observed is a little iron pyrites, but for the most part the deposit is deficient in mineralization. A few chains southeast there is a quartz vein on which a pit had been sunk some years previously by Steve Lafreica, of Fort Matachewan. This quartz vein

Brookbank Claim.—This claim (17801) lies in the southeast corner of Alma township where the rock is a red syenite. Some work has been done about four chains west of the east boundary of the township and just northeast of the cabin which is on the boundary. Here there is a N.-S. vein on which two pits had been sunk. The vein is about 2 inches in width between the pits, showing for 30 feet. The vein filling is chiefly quartz, but contains also some galena, copper pyrites, pyrite, and some barite and fluorite. No gold was observed, but one assay of 2 inches of vein contained \$5.20 in gold and 8 oz. in silver, while another of 5 inches in width from the north pit gave \$7.60 in gold and 8 oz. in silver.

Cooper Claim.—Gold is also reported on the Cooper claim (MR 5645), which lies nearly a mile northwest of the Brookbank.

The above properties were not being worked during

contains small quantities of cobalt bloom, iron and copper pyrites, which first attracted attention, but promising values in gold or silver were not obtained on assay.

The Keewatin rocks accompanying these veins are quite schistose, igneous and sedimentary. To the north of the first mentioned deposit there is a whitish altered porphyry which shows phenocrysts of orthoclase and plagioclase in a groundmass of feldspar and quartz, with much sericite and calcite. Near this altered porphyry there is ashy weathering chert, or iron formation. Part of the south wall of the deposit is schistose quartz-porphry with conspicuous phenocrysts of quartz.

Intruding the schist in the north parts of these claims there is a red orthoclase porphyry that has been referred to previously as gold-bearing. Iron pyrites occurs abundantly in portions of this rock, and there has been considerable oxidation, resulting in the break-

ing down to a red earthy material or loose fragments on the surface, that has involved a certain amount of surface concentration. This condition varies greatly in different parts of the property; on some of the knolls there are only a few inches or less of oxidized rock, but one trench shows over six feet of loose oxidized material. Consequently, for a proper examination of the deposit, it would be necessary to prospect below this shallow rusty surface by means of open cuts through the weathered rock, by drilling, or by shafts.

The porphyry is cut by numerous veinlets of quartz which in places carry visible gold, that frequently occurs near the contact with the porphyry and also in the wall rock, near the veinlets. In one deep trench there are several flat-lying quartz veins from a fraction of an inch to two inches in width. In other places the quartz veins may be irregular in their distribution, the whole mass occurring like a stockwork. It is quite likely the quartz veins are genetically connected with the porphyry, being the filling of tension cracks that have developed on the cooling of the rocks, while the gold has accompanied the quartz in the formation of these veins. Sometimes gold can be observed deposited on grains of iron pyrites in the quartz or along the wall rock. A few samples were taken from the Davidson by the writer. One of these, from the surface of the porphyry in a trench on claim 5372, gave on assay \$10.00 per ton over a length of 15 feet. The porphyry here was not so altered as is frequently seen, but visible gold was observed in minute quartz veinlets near the place from which the sample was taken.

Another surface sample from a long trench at the northeast corner of the claim gave on assay a value of \$15.20 over a length of ten feet in the trench. Several specimen samples of quartz and porphyry carrying iron pyrites gave values of 80 cents to \$2.00 per ton. None of these assays are quoted as representative of the actual value of the whole mass of the porphyry, but indicate its gold-bearing character. It may be found on extended examination that there are isolated parts of the porphyry which are sufficiently enriched with gold to be of economic value.

The following is a description of a microscopic examination of gold-bearing porphyry and quartz from Davidson claim 5372:

Orthoclase crystals are set in a groundmass of smaller feldspar crystals with a little chlorite in flakes and scattered crystals of apatite. Calcite is abundant as a secondary mineral. Quartz occurs in small secondary masses and in veinlets. Cubes and irregular grains of pyrite with an oxidized surface of limonite are frequent in the porphyry and also in the quartz veinlets. The quartz veinlets contain clear secondary feldspar, plagioclase and microcline moulded on the older feldspars of the porphyry. Vein calcite also accompanies the quartz in the veinlets, while native gold occurs near the wall rock in the quartz. A small amount of copper pyrites is occasionally seen. None of the rarer minerals, like the tellurides, have been recognized in any of the samples examined.

Otisse Claims (5379-5380).—These claims lie directly east of the Davidson group, and, owing to a somewhat deeper covering of drift and a smaller amount of trenching, the distribution of the rocks is not as well known.

In the northwest part of claim 5379 the orthoclase porphyry is well exposed. There is also a surface oxidation similar to the Davidson, with an amount of loose brown earthy material in which trenches were made. Gold has been found in a number of pits in the same association as in the porphyry on the Davidson.

To the east of this outcrop other occurrences of porphyry have been located by Sam Otisse in heavily timbered country; it is probable that a band of porphyry extends through the northerly part of the claims.

Near the centre line of the claims, a few chains north of the south line, there are outcrops of rusty weathered schist in which native gold has also been discovered. This band of rock lies to the south of the porphyry band. Below the oxidized surface the rock is light grey in color and spotted with pyrite. Examined under the microscope it contains much secondary silica, calcite, sericite, and iron pyrites, indicating that the rock has been entirely altered by replacement from its original composition. Mr. Otisse discovered gold at several other places on his claims in rocks which are of different character from those described above.

An examination of these properties in January last resulted in options being taken on these and adjoining claims, and it is expected that during the summer of 1918 a thorough examination will be made to prove their possibilities as gold producers.

Otisse Claim (5376).—This claim lies north of the Davidson claim, 5372. The rocks are largely schistose sedimentary rocks intruded by narrow porphyritic dikes. Six chains north of the Davidson claim there is a quartz vein striking nearly east and west and three to four feet wide in places. It contains, in parts, copper pyrites, iron pyrites, and galena. Fragments of grey porphyry in the quartz suggest that the vein was formed along an old porphyry dike. Gold values are reported from this vein. A selected sample of quartz, galena, and copper pyrites contained \$1.20 in gold per ton.

In the southwest part of the claim there is a narrow red porphyry dike that strikes northwesterly to the Robb claim. It contains quite large crystals of orthoclase, and is probably a narrow dike representative of the stock-like mass of red porphyry on the Davidson. Gold is reported to occur in this dike.

O'Connell Claims (5389-5390).—On claim 5389, adjoining the boundary line between Powell and Cairo, there is a reddish feldspar porphyry dike that intrudes a slate-like rock of Keewatin age. This porphyry is much harder than that on the Davidson and Otisse claims, and does not show so heavy a mineralization with iron pyrites. It is cut by quartz veinlets, and has been partly prospected by stripping and a shallow open cut. Low values in gold from this material are reported by the owners.

On claim 5390, one mile south, work was done on a band of blackish chertlike rock cut by quartz veinlets with pyrite, from which low gold values were also obtained.

Fluorite and Barite.

Fluorite (fluorspar) has been found in small quantity in a number of quartz veins in Cairo and Alma townships, but none of the deposits examined are of commercial value. Owing to the widespread occurrence of the mineral, it is possible that prospecting might result in the finding of economic deposits. The mineral is of a deep purple color, occurring in small masses in the quartz or in the wall rock adjacent to the veins. It is also present in the Biederman barite vein. One occurrence where the fluorite is in the quartz is on the Harvey claim, No. 18285, west of the road from Fox rapids north to the Craig claims. This vein is about seven inches wide, strikes N. 75° E., and has been traced several hundred feet. Some pieces of fluorite, two inches across, were taken from the vein. All the showings of fluorite are in the syenite.

Veins containing barite occur in several parts of the area. These are generally small, but two deposits have been found which would be of commercial value were they nearer railway transportation. These are the Biederman deposit in Cairo township, and a deposit near Yarrow lake in Yarrow township.

Western Branch C. M. I. Annual Meeting

The annual meeting of the Western Branch of the Canadian Mining Institute was held at Vancouver, B.C., on May 27th, when there were present representatives of the mining industry of all sections of the Province.

It was agreed that steps would have to be taken to shake up the organization, it being the opinion that it had not been taking its proper part in the development of the industry in the West during the past year or more. In the selection of officers, therefore, care was taken to appoint men who can be depended upon to interest themselves as members of the C.M.I. in all problems, small or large, affecting Provincial mining.

The following committee was appointed: Mr. J. D. Galloway, Provincial Resident Engineer of Mineral Survey, District No. 2, with headquarters at Hazelton, B.C.; Mr. George Winkler, of Victoria, B.C.; Mr. John Hunt, General Superintendent of the Canadian Western Fuel Co., Nanaimo, B.C.; Mr. Thomas Graham, General Superintendent of the Canadian Collieries, Cumberland, B.C.; Prof. N. Turnbull, Professor of Mining at the University of British Columbia; Prof. J. G. Davidson, Professor of Physics at the University of British Columbia; Mr. A. B. Clabon, President of the Vancouver Chamber of Mines; Mr. E. A. Haggen, Editor of the Mining and Engineering Journal of Vancouver, B.C.; Mr. Robert R. Bruce, manager of the Paradise Mine, East Kootenay, B.C.; Mr. S. S. Fowler, manager of the New Canadian Metal Co., B.C.; Mr. Oscar Lachmund, General Manager of the Canada Copper Corporation; and Mr. E. E. Campbell, Superintendent of Mines of the Granby Consolidated Mining and Smelting Corporation; Mr. R. H. Stewart, manager of the Sunloch Mines, was made Chairman, and Mr. W. Fleet Robertson, Provincial Mineralogist, Vice-Chairman.

For the purpose of keeping informed on problems affecting every branch of mining it was decided that the Committee should be given power to appoint sub-committees whose duty it would be to keep in touch with matters affecting the classes of mining work to which they were assigned and in the selection of which the special qualifications of the respective members would be the only consideration. These sub-committees will be as follows: Coal, Copper-Gold, Silver, Lead and Zinc, Legislation, Membership. These smaller bodies, composed of competent men, will keep the Association posted and make recommendations as to its policy in respect of all questions of interest to mining men. It is the hope that in this way the C.M.I. may make its voice heard with effect in the development and the administration of the mining activities of British Columbia.

The meeting was marked by three interesting papers. One by Mr. Frederick Keffer, read by Mr. W. M. Brewer, was entitled "Flotation Practices at Highland Valley Mines." Another on "Petroleum in British Columbia" was by Mr. E. A. Haggen, and a third by Mr. E. E. Campbell, of the Granby Consolidated, was on "Mining Operations at Anyox, B.C."

ELECTRIC SMELTING OF IRON ORES OF B.C.

Dr. Alfred Stansfield, of Montreal, has accepted a commission at the hands of Hon. Wm. Sloan, Minister of Mines, acting on behalf of the British Columbia Government, to make a full investigation into the commercial possibilities of the application of electrical smelting methods to the development of the iron ore resources of the Province. Dr. Stansfield is expected to reach Victoria, B.C., about the middle of the month of June. All the information available to the Department of Mines, as well as the services of one or more of the Provincial Resident Engineers, will be placed at his disposal, so that he can count on having every facility for the immediate commencement and the uninterrupted pursuit of the undertaking.

It was Mr. Sloan's opinion that, in view of the recent advances made in electric-metallurgy, it was essential that the views of an expert be secured as to the adaptability of British Columbia's iron ores to electric smelting, particularly at a time when there are such opportunities and so strong a general demand for the economic development of the long dormant iron deposits of this section of Canada. This would be Dr. Stansfield's first duty and he would, therefore, have to make a close study of the character of the contents of the magnetites and hematites of the Province. He then would go into the various problems in connection with the installation of an electrical smelting plant, its cost, construction and so forth and would follow this up with an estimate of the cost of production of iron by this method from the ores with which the plant would be supplied. He also would be able to give valuable information as to the quality of the iron so produced. All this was information which would be of the utmost assistance in the guidance of those contemplating investment in the manufacture of pig iron from British Columbia ores and in the building up of kindred industries in the Province.

Dr. Stansfield is Professor of Metallurgy at McGill University and a consulting metallurgist of the highest standing in Canada. Before coming to Canada, about 10 or 12 years ago, he had established a reputation in England. For years he has been consulted by the Dominion Government on all electro-metallurgical questions, besides being the advisor of most of the steel manufacturing concerns of the East with reference to the production of electro-smelted high-grade steels. In 1914 he was engaged by the Dominion Government to investigate the electro-smelting of iron in Sweden, on which he prepared a very instructive report. He has held the position of secretary of the Iron and Steel Institute of Canada and is secretary of the Iron and Steel Section of the Canadian Mining Institute.

NEW DOME DIRECTOR.

Toronto, June 12.—The annual meeting of the Dome Mines Company was held yesterday afternoon at the office of Mr. Alex. Fasken. It was announced that the main shaft had just reached the 1,250-foot level, where a station would be cut and a drift started to the Dome Extension line. No definite promise was made for the re-opening of the mill closed some months ago owing to labor conditions.

Mr. W. B. Royce, President of the National Surety Company, New York, was elected to the directorate in place of Mr. J. S. Wilson, Massey, Ont. The chair, in the absence of President De Lamar, was occupied by Mr. J. S. Edwards, the First Vice-President.

Ontario's Metalliferous Production

First Quarter, 1918.

Returns received by the Ontario Bureau of Mines for the three months ending March 31st, 1918, are tabulated below. For purposes of comparison the quantities and values are given for the corresponding period in 1917. **Summary of Metalliferous Production—First Quarter of 1918.**

Product.	Quantity,		Value \$.	
	1917	1918	1917	1918
Gold ozs.	127,692	113,387	2,601,760	2,265,521
Silver " 3,945,957	4,114,856	2,831,873	3,740,843	
Cobalt (metallic) . lbs.	84,710	37,545	78,668	75,625
Cobalt oxide	83,014	81,760	66,798	130,486
Nickel oxide	5,495		550	
Nickel (metallic)		44,154		17,662
Other Cobalt and Nickel Compounds	118,292	143,381	13,695	18,386
*Nickel in matte . tons	10,141	9,677	5,070,410	5,806,200
*Copper in matte	5,063	4,727	2,025,227	1,748,990
Copper Ore	1,507		44,097	
Iron Ore	23,035	32,530	58,205	127,916
Pig Iron	163,020	148,752	2,743,441	3,948,209
Molybdenite, concentrates . lbs.	25,073	17,410	32,202	24,548
Lead, pig	263,046	60,283	27,290	5,066

* Copper in matte was valued at 20 cents and nickel at 25 cents per pound in 1917. For 1918 the values have been placed at 18½ and 30 cents per pound respectively.

Gold.

Production for the quarter shows only a small decrease which is a creditable showing considering the various handicaps under which gold miners are laboring. The Hollinger Consolidated had an increase in production. This was offset, however, by the closing down of the Dome mill. The Croesus mine in Munro township has closed down temporarily. At Kirkland Lake a new producer, the Lake Shore, has been added to the list. During the quarter 262,577 tons of ore were milled with a recovery of 113,387 ounces of gold and 20,221 ounces of silver as compared with 350,916 tons milled during the corresponding period in 1917. Hollinger produced 68,804 ounces of gold and McIntyre 21,461 ounces, the next largest producer being the Porcupine V.N.T. The Patricia Syndicate at Boston Creek expect to have their new mill in operation about June 1st.

Silver.

Shipments of silver for the first quarter of 1918 show a small increase in quantity and a considerable increase in value. The average New York price for the period was 87.5 cents per fine ounce or nearly 12 cents increase as compared with the corresponding period in 1917. The passing of the Pittman bill in the United States recently has established virtually a price of \$1.00 per ounce. Companies shipping one quarter million ounces or over are named in order: Nipissing, Kerr Lake, Mining Corporation of Canada, Buffalo, O'Brien and Coniagas. The Mining Corporation of Canada has been remodeling its mill in order to re-treat a large tonnage of tailings from the Cobalt Reduction mill. At the McKinley-Darragh a new 200-ton oil flotation plant has been put in operation. Of a total of 4,114,856 ounces shipped, 20,221 ounces is credited to silver recovered from gold ores.

Refineries: There were treated at Southern Ontario refineries during the quarter 1,242 tons of ore and concentrates and 1,483 tons of residues from Cobalt and out-lying silver camps. Silver bullion recovered was 1,610,989 ounces, worth \$1,394,599. In addition, arsenic, cobalt and nickel oxides and sulphates, nickel carbonate, metallic nickel and metallic cobalt were produced. Of the latter, 22,752 lb. was used in the manufacture of "stellite," which is a cobalt alloy used as a high speed cutting tool. One feature of note is the

great increase, 100 per cent., in value of cobalt metal and oxide due to the increasing uses and demand for these products.

Nickel-Copper.

Production from Copper Cliff and Coniston smelters for the quarter shows a small decrease as compared with the same period in 1917. Ore was raised from the Creighton and Crean Hill mines of the Canadian Copper Co., the Alexo; and the following mines of the Mond Nickel Co.—Garson, Victoria No. 1, Worthington, Levaack and Bruce. Of a total of 354,689 tons raised, about 70 per cent. came from the large and rich Creighton ore-body. There was 325,386 tons of ore smelted in the period, with a resulting product of 17,992 tons of nickel-copper matte.

The British America Nickel Corporation has acquired a site to erect its \$1,000,000 refinery on the Quebec side of the Ottawa river, between Aylmer and Hull. The new refinery of the International Nickel Company of Canada at Port Colborne is nearing completion.

Iron Ore and Pig Iron.

Shipments of iron ore were made from the Helen and Magpie mines of the Algoma Steel Corporation. Hematite ore from the Helen is shipped to the Magpie, where it is mixed with siderite ore and roasted. The entire shipments from the Magpie went to the Sault blast furnaces. From Moose Mountain, Limited, Sellwood, shipments were made of magnetic concentrates, briquetted and converted to hematite in a kiln. Only 447 long tons were exported to the United States during the quarter.

At Sault Ste. Marie, Port Colborne, Hamilton and Deseronto, eight blast furnaces were in operation. The tonnage smelted was 34,552 tons of Ontario ore and 260,476 tons from the United States. As shown by the table, the output of pig iron was considerably less than for the corresponding period last year.

Molybdenite.

Molybdenite ore, to the extent of 1,295 tons, was treated by the Mines Branch, Ottawa, and by the Renfrew Molybdenum Mines, Ltd., at Mount St. Patrick. The output of the last mentioned company is shipped direct to France. There are works at both Orillia and Belleville for the production of ferro-molybdenum.

Lead.

The entire output of pig lead resulted from the operations of the Galetta lead mine and smelter owned by the Jas. Robertson Estate, Montreal. During the quarter 3,347 tons of ore was mined. The smelter operated during the last few days of March only. Operations by the Kingston Smelting Company ceased in December of last year.

The Order-in-Council dated May 31st, 1918, with reference to assessment work is as follows:

"Upon the recommendation of the Honorable the Minister of Lands, Forests and Mines, the Committee of Council advise that on any mining claim where in consequence of the provisions of The Mining Act of Ontario and a certain Order-in-Council dated 26th May, 1917, two instalments of work are required to be performed, wholly or in part, within the space of twelve months, the time for performing the second of such instalments be extended twelve months, and the time for performing each and every subsequent instalment of work, if any, on such claim, be likewise extended twelve months; and that in computing the time within which any such work is required to be performed, the period of time necessary for such extension be excluded."

THE MADOC AREA.

The development of the fluorspar mining industry has again directed attention to the Madoc area. At Madoc 80 years ago there was located one of our first iron furnaces, iron ore being obtained from the Seymour mine. Thirty years later a rich gold deposit was discovered a few miles from Madoc and consequently the area received considerable attention from prospectors. Many mineral deposits were found and some of them worked. During the past few years a tale mine and a pyrite mine in the area have been regularly and profitably operated.

The Madoc area was geologically re-surveyed by W. G. Miller and C. W. Knight in 1912 and their report and map were published in the annual report of the Ontario Bureau of Mines, 1913. The rocks are described in detail and their relationships discussed. Most of the rocks are pre-Cambrian, but a considerable portion of the area is covered by Palaeozoic sediments. The Henderson tale deposit at Madoc occurs in a crystalline dolomitic limestone. The iron pyrites deposits near Queensboro occur as lenses in contact with rusty schists and quartzite near an intrusive mass of felsite.

Most of the fluorspar produced is used as a flux in basic open-hearth steel furnaces. Probably four-fifths of the output is consumed in this way, fluorspar being much prized for its property of increasing the fluidity of the molten mass in the furnace and also for its assistance in the removal of phosphorous and sulphur. It improves both the physical character and chemical composition of furnace products.

Fluorspar is used in the manufacture of opalescent glass and enamel ware. For this purpose a very good grade of ore is required.

The term "gravel spar" is often used to designate a comparatively impure grade of spar that is not suitable for such purposes as glass and acid manufacture, though suitable for use in steel furnaces and iron and brass foundries. The term "gravel" is also used for disintegrated fluorspar, as distinct from "ground" spar. The natural coarse product is commonly called "lump."

In Kentucky, fluorspar occurs in veins in fault fissures cutting limestones, sandstones and shales of Carboniferous age. The associated minerals are barite, calcite, galena and sphalerite.

In Illinois, the fluorspar deposits fill fault fissures in Lower Carboniferous limestones and sandstones. The associated minerals are calcite, galena, sphalerite and occasionally pyrite or chalcocopyrite.

SMITH & TRAVERS COMPANY, LIMITED.

The Smith & Travers Diamond Drill Co., Ltd., and the Smith & Durkee Diamond Drilling Co., Ltd., both of Sudbury, Ont., have disposed of all their assets to a new company to be known as the Smith & Travers Co., Ltd.

Dominion Letters Patent incorporating the company have been granted, giving very wide powers. The capital stock is \$500,000, divided into 5,000 shares of \$100 each. The management will be made up from the active members of both companies. The scope of the company is very great. Each department will be in charge of the man who appears best suited for the work. It happens that every man on the staff has had several years of active experience in the special work he is chosen to superintend. The organization consists not only of men of long practical experience, but also technical men as well, so that every phase of the work of exploring mineral lands can be done intelligently.

Scientific exploration is done for three reasons, namely, to determine tonnage and grade for financing, structure of ore-bodies for the mining man and the quality of ore-bodies for the metallurgist. To do this requires not only a knowledge of boring holes, but also a knowledge of engineering and structural geology. Therefore, with such an organization, it is hoped that a greater and broader service can be given the mining industry of Canada.

The Board of Directors have elected T. E. Smith, President, Thomas Travers, Vice-President, and T. H. Hale, Sec.-Treas. Mr. Smith has had over thirty years' experience in diamond drill exploration in the United States and Canada. The new company is most fortunate in retaining his services because of his long experience, broad acquaintance and business ability. Mr. Travers and O. R. Smith, who have had charge of field work for several years, will continue in the same capacity. The shop, maintenance of outfits and transportation will be in the hands of Wallace N. Smith. C. H. Hitchcock, for the past seven years Exploration Engineer for the Dominion Nickel Copper Company, now the British America Nickel Corporation, Ltd., and the Canadian Copper Company, will act as geologist and have charge of the company's land interests.

The company owns thirty-four diamond drilling outfits. These vary in capacity from the smallest types, suitable for portaging over the lakes and rivers of the North country, to large capacity outfits capable of drilling to a depth of 3,000 feet. The company is now drilling at the Creighton Mine at a depth of 2,700 feet vertically. This is deeper than any shaft or bore hole ever before sunk in the Sudbury nickel district.

In order that these many outfits may be kept in first-class condition, the company maintains its own shop for repairs and maintenance. This is an important feature and insures complete and first-class equipment on the contracts, hence better service to those who may employ the company.

A geological department with all facilities for examination work, geological mapping and laying out of schemes for exploring mineral lands, is maintained. The long experience of the management in boring holes, proper schemes of exploration to be applied to different types of ore bodies, proper handling of core, analysis and computation of tonnage, makes it possible for the company to give the mining industry the best assistance obtainable.

Hereafter it is prepared to assist in the development of mineral lands by doing exploratory work on meritorious properties in return for an interest. On account of the company's facilities for scientific exploration and sale of properties, it is hoped that the owners of mineral lands and the company may be mutually benefited. It is felt that in time this may become the most important part of the company's business.

It happens, almost without exception, that some member of the present staff of Smith & Travers Co., Ltd., has assisted in some capacity in every exploration that has ever been done in the Sudbury Nickel District. The information that the company has regarding land ownership, extension ore-bodies, and areas favorable for future exploration, is enormous. The facilities offered mining companies and individuals who are interested in nickel lands either as buyers or sellers, are very great.

Probably no mining district in Canada offers scientific explorers of mineral lands quicker or greater rewards than the Sudbury Nickel District, Canada's richest mining camp.

Ontario's Mineral Wealth

ONTARIO IS CANADA'S PREMIER MINERAL PROVINCE, the 1917 output being 46 per cent. of the total production from Canada.

The rapid growth of Ontario's Mineral industry may be gleaned from the following figures:

Year.	Value.	Year.	Value.
1893.....	\$6,120,753	1914.....	\$46,295,959
1903.....	12,870,593	1915.....	54,245,679
1913.....	53,232,311	1916.....	65,303,822

Preliminary returns show a production for 1917 exceeding \$71,000,000 in value.

NICKEL: The Sudbury area produces 85 per cent. of the nickel of the world. In 1917 the nickel-copper matte output contained 41,887 tons of nickel valued at \$20,943,500 and 21,197 tons of copper worth \$7,842,890.

SILVER: Chiefly from Cobalt and outlying camps, 19,479,807 ounces of silver, worth \$16,183,208, were produced in 1917. The total silver production from these camps up to the end of 1917 was 274,723,972 ounces, valued at \$151,950,561.

GOLD: For 1917 the gold output was 420,893 ounces, worth \$8,698,735. From the Porcupine camp the total production to the end of 1917 was \$36,430,066. At the Kirkland Lake camp the following mines are producing gold: Tough - Oakes, Teck - Hughes and Lake Shore.

Dividends and bonuses paid to the end of 1917 were \$71,177,116 from the Cobalt Silver Camp, and \$11,486,167 from Porcupine and Kirkland Lake Gold Camps.

The total valuation of the chief metals produced in Ontario to 31st December, 1917, is as follows:

Silver	\$167,611,708	Nickel	\$110,170,120
Pig Iron	77,561,181	Gold	42,362,383
Copper	41,414,290	Cobalt	4,303,769

Ontario's mineral resources cover practically the entire list of metallics and non-metallics with the exception of tin and coal.

The producing camps are readily accessible by railway, the climate is invigorating and healthful, water power is abundant, and other conditions are favorable for mining.

Fluorspar Mining in Ontario

The manufacture of munitions and the shortage of shipping has resulted in a more intensive investigation of the mineral resources of North America. Minerals used in the iron and steel industry have naturally been in great demand and the difficulties in connection with importing from the usual sources have given added value to domestic deposits. The unusually large production of special steels has made it necessary to utilize more extensively Canadian ores of such metals as chromium, nickel, molybdenum, cobalt, etc., and also all minerals needed in metallurgical works. Among the latter minerals is fluorite, which is used as a flux. The production of fluorite in Ontario has never been large; but has recently become important and is expected to increase considerably in the near future.

and in foundries. Fluorspar is also used in comparatively small quantities, however, in the manufacture of hydrofluoric acid and various fluorides and fluosilicates.

Fluorspar Properties near Madoc, Ontario.

Canadian steel furnaces use annually from 10,000 to 15,000 tons of fluorspar; but until recently almost all of this was imported. During 1916 shipments from the Madoc district became notable, amounting to 1,284 tons valued at \$10,238. During 1917 there was produced 4,326 tons valued at \$66,474. It is expected that in both tonnage and in value per ton the production during 1918 will far exceed that of the previous year. A number of properties are being developed and the prospects for a busy summer are excellent.

Map showing location of fluorite properties in Madoc area.

When heat is applied to the charge in an iron or steel making furnace, there commonly results the formation of a lighter fluid mass, containing most of the impurities, which rises to the top of the molten mass. It is the function of the furnace process to thus separate the useless and harmful substances from the metal. It was long ago found that a small quantity of fluorspar added to the charge very greatly increased the fluidity of many slags and thus allowed the separation to be more rapidly and completely made. Fluorspar is, therefore, regularly used in iron and steel works

Canadian Fluorite, Ltd., through J. W. Bradley, is operating the Kane property, Lot 9, Con. 14, Huntingdon, from which shipments are being made to the new steel plants of British Forgings, Ltd., at Toronto. The shaft is 25 ft. deep on a vein about 9 ft. wide. The vein matter is largely calcite. At 25 ft. depth there is considerable fluorite in the vein. The plant consists of a 325 cu. ft. compressor, 35 h.p. upright boiler and an 8 x 12 hoist. E. D. Hall is superintendent. Ten men are employed.

Canadian Industrial Minerals, Ltd., has about 800 acres, including Lot 13, Con. 12; Lot 14, Con. 11; Lot 15, Con. 10; Lot 16, Con. 9, and part of the north half of Lot 12, Con. 11, Huntingdon township. The first mentioned, Noyes lot, was operated formerly by Wellington & Munro.

A shaft has been sunk 100 ft., and at the bottom of the shaft there is 9 to 12 ft. of clear fluorspar. At 50 ft. a level is established and 140 ft. of drifting done. The company is installing a 784 cu. ft. Ingersoll-Rand compressor electrically driven by 125 h.p. motor. Plant on the property consists of 2 boilers, 35 and 60 h.p., and a 6 x 8 hoist.

C. E. Watson is general manager of Canadian Industrial Minerals, Ltd. A. W. Grierson is resident manager.

The Wallbridge property, west half Lot 1, Con. 4, Madoc, has produced 380 tons of spar. The vein has been stripped 500 ft. It varies from one to three feet

The Bailey property, Lot 1, Con. 4, Madoc township, is being unwatered by J. W. Bradley, the property being held under option for Canadian Fluorite, Ltd. The shaft is 40 ft. deep and 35 ft. of drifting has been done at the 40 ft level.

This deposit was opened late in 1916 by the Hungerford Syndicate. (Harry Hungerford and Robert Gilchrist.) Robert Phillips was in charge of operations.

The vein matter is well crystallized and some splendid spar was taken out during development.

The south Reynolds property, Lot 7, Con. 13, Huntingdon township, is under option to Chas. Henrotin. Two carloads of fluorite have been shipped from an open cut on the vein, the vein is narrow, being under 18 in. wide. About 150 ft. has been exposed in the open cut.

The Herrington property, Lots 1 and 2, Con. 12, Huntingdon, has been leased to Chas. Henrotin. Thirteen tons have been shipped. The vein has been stripped for 250 ft. It is about 18 in. wide.

Fluorite from Madoc, Hastings Co., Ont.

wide. A second vein, 700 ft. west of the first, has been uncovered for 100 ft. In a pit 15 ft. deep on this second vein at the boundary with the Ponton property, the vein is 6 inches wide. On the Ponton property, west half Lot 3, Con. 1, Madoc, a vein stripped for 300 ft. is up to 3 ft. wide.

From the Perry property, Lot 11, Con. 13, Huntingdon township, operated by Cross & Wellington, about 3,000 tons of fluorspar has been shipped, the property is shut down at present owing to water trouble. It is the intention of its operators to install a double action, motor driven Cornish pump to overcome this difficulty. There are three shafts which are respectively 35 ft., 80 ft., and 95 ft. deep. Plant consists of a 50 h.p. boiler, 470 cu. ft. compressor driven by 75 h.p. motor and an 8 x 12 hoist.

The Lee property, west half Lot 1, Con. 1, Madoc township, is held under lease by Chas. Henrotin. Five cars have been shipped from an open cut. The vein is 3 ft. wide at its widest parts. The open cut is 500 ft. long and is in places 8 ft. deep.

On the North Reynolds property, Lot 8, Con. 14, Huntingdon township, there is a pit 10 ft. deep.

The McIlroy property, Lot 2, Con. 4, Madoc, is operated by Mineral Products, Ltd. The vein is one to three feet wide. It is developed by a shaft and an open pit.

Fluorspar has recently been found in a number of quartz veins in Cairo and Alma townships in the Metachewan gold area, Northern Ontario. According to Mr. A. G. Burrows, the mineral in these deposits is of a deep purple color.

PROVINCE OF ONTARIO

BUREAU OF MINES

Mining in Eastern Ontario

Eastern Ontario is noted for the number and variety of its minerals, which are found chiefly in the pre-Cambrian rocks. These minerals include lead, molybdenite, gold and iron among the metallics. In the non-metallic list the following were mined in 1917, the arrangement being in order of the value of output: Graphite, Talc, Iron Pyrites, Mica, Feldspar, Fluorspar, Corundum and Quartz.

THE TOTAL VALUE OF THE MINERAL OUTPUT FROM EASTERN ONTARIO IN 1917 WAS APPROXIMATELY \$1,186,000.

This does not include materials of construction, such as stone, sand and gravel, cement, lime, or clay products. Other Eastern Ontario minerals include marble, sodalite, arsenic, and apatite or phosphate of lime.

As to the importance of these resources, it may be pointed out that there is at Madoc the largest deposit in North America of high-grade talc, the greatest body of high percentage potash feldspar (Richardson mine) at Desert lake in Frontenac county, the most important amber mica mine (Lacey) at Sydenham, and the greatest graphite mine (Black Donald) at Calabogie.

Incidental to the war many minerals have come into prominence, among which may be mentioned iron pyrites, molybdenite and fluorspar. The first-mentioned is mined at Queensboro, Sulphide and near Flower station in Renfrew county. The highest grade iron pyrites deposit in Canada is located at Queensboro, in Hastings county. Molybdenite is very widely distributed in Eastern Ontario, and fluorspar is mined near Madoc, in Hastings county.

The Ontario Bureau of Mines issued a geological Report in 1913 with accompanying maps of parts of Eastern Ontario. This and other reports dealing with the minerals of this part of the Province are available on application to

Ontario Bureau of Mines,
Parliament Buildings,
Toronto.

G. H. Ferguson,
or
Minister of Lands, Forests and Mines,
Toronto.

THE MADOC TALC INDUSTRY.

The Madoc district, Hastings County, which is receiving much attention at present from companies developing fluorspar deposits is the chief source of Ontario's tale. The production of this mineral was seriously interfered with by the war as increased ocean freights made it impossible to continue exports to Great Britain. Exports to the United States have, however, greatly increased and the production in 1917 was 16,076 tons valued at \$179,554, as compared with 11,810 tons valued at \$111,489 for the previous year. The greater part of the tale comes from the Henderson mine near Madoc. It is ground in the mill of G. H. Gillespie & Co. at Madoc. The Anglo-American Tale Corporation has erected a mill on their property adjoining the Henderson mine.

Ground tale is used as a filler in the manufacture of paper, cotton, rubber, etc., and a considerable quantity is used in the form of talcum powder.

The Mundie mine, Lot 25, Con. 6, Madoc township, Hastings Co., Ontario, is being re-opened by the Bannockburn Pyrite Mining Co. An open pit 50 by 100 ft., and 60 ft. deep has been unwatered. J. A. Anderson, of Bannockburn is manager.

The International Pulp Co. of Gouverneur, N.Y., is prospecting the Pitts farm property, Lot 14, Con. 14, Huntingdon township, Hastings Co. An incline shaft has been sunk 50 ft. E. Brownson is manager.

For some years Mr. George Gillespie has been largely responsible for keeping Madoc, Ontario, on the mining map. Mr. Gillespie is the moving spirit of the tale mining industry of Ontario and his mill is located at Madoc, where it is close to Canada's greatest tale mine.

During the past year a number of mining men have been visiting Madoc and vicinity in an endeavor to obtain fluorite to supply the needs of Canadian iron and steel manufacturers. Their activity has resulted in the establishment of practically a new industry at Madoc—the mining of fluorspar.

Map of Ontario, showing location of Madoc area.

LEAD AND ZINC IN EASTERN ONTARIO.

Lead and zinc are not produced in large quantities in Ontario; most of Canada's production of these metals being made by British Columbia. There was produced in Ontario in 1917 ore yielding 1,772,512 pounds of lead, valued at \$172,601. During the first quarter of 1918 there was mined 3,347 tons of ore. The only producer is the Galetta lead mine and smelter owned by the Jas. Robertson Estate. The Kingston Smelting Company's smelter ceased operation in December, 1917.

A report by W. L. Uglow on the lead and zinc deposits in Ontario was published by the Ontario Bureau of Mines in 1916. He says of the Galetta deposit:

"The Galetta lead mine is located on Chats island in the Ottawa river, about five miles directly east of the town of Arnprior. The island is separated from the mainland by a narrow channel of the Ottawa river.

"The vein is a fissure-filling of the same type as the Frontenac lead mine vein. Its strike varies from N. 45° W. to due north (magnetic), and consequently it cuts nearly at right angles across the strike of the pre-Cambrian series. It usually has a steep dip towards the southwest. The vein occupies a well-marked fault fissure. Near the northwest end, a small open cut shows on the northeast wall of the vein the steeply-dipping north-easterly striking gneisses of the pre-Cambrian and on the other the flat-lying Paleozoics, indicating a downthrow to the southwest. Horsts of country rock occur throughout the vein, suggesting a fault breccia, while drag-folding is very evident at some places along the fracture.

"The gangue is very largely calcite showing the banded character of a crustified vein, similar in all respects to that of the Frontenac lead mine. In some places in the vein, barite seems to be rather abundant. The chief ore mineral is galena, which occurs in grains, clusters of crystals, and thin sheets, usually parallel to the banding of the gangue."

The statement of Dome Mines, Ltd., for the year ending March 31, shows a profit of \$355,023 during the first eight months and loss of \$118,564 during the last four months.

Added to the loss of \$118,564 for the last four months is \$282,328 for depreciation of plant, thus making a total of 400,893, as against the profits of \$355,023 during the first eight months, and thereby showing a net deficit of \$45,869. In addition to the deficit of \$45,869 are deducted from the surplus as of one year ago war taxes on profits amounting to \$26,384 and dividends of \$100,000, thereby reducing by \$172,253 the surplus of the preceding year. The surplus as of March 31, 1917, was \$697,051, as compared with \$524,797 as of March 31, 1918.

Goudreau, Ontario, 177 miles north of Sault Ste. Marie, on the Algoma Central railway is attracting attention as a possible gold district. The Goudreau pyrite mine, operated by the Nichols Chemical Company, is a big producer and considerable mining activity has been carried on in the past few years. It is not surprising that prospecting has resulted in the discovery of gold.

According to the "Sudbury Star," engineers Alderson and Reid have investigated the recent discoveries. The properties of D. J. McCarthy and J. B. Miller will probably be explored under option by the interests these engineers represent.

The "Ingersoll-Rogler" Air Compressor Valve

By A. W. SWAN.

The air compressor is in some respects similar to the steam engine, but the indicator card is traced in the reverse direction, and the cut-off point on the steam card becomes the release point on the air card. It follows that the valve requirements for engine and compressor are not entirely the same, and as a matter of fact the development of the two types have followed different lines. In the steam engine the point of cut-off is important, and in order to vary the cut-off, both for economical running and regulation of speed, the steam discharge valve in all forms is mechanically operated. The air compressor is regulated either from the driving end or by some form of unloader, and the shape of the compression line is looked after by the water jacketing. Both inlet and discharge valve should open at the proper pressure, open quickly and fully, and close quickly at the right time. It follows that pressure is the only important factor, and that while for the steam engine mechanical valve operation is necessary to control the release and compression, there is no such need for the compressor, hence the friction and complication of mechanical control is unnecessary.

The alternative to the mechanically operated valve is found in the spring-controlled valve. In addition to the desirable features mentioned above, the spring-controlled valve should be such that the spring is not heavy enough to absorb useful power in opening and holding open. It was this feature of the heavy spring that created a prejudice against the spring type of valve. Recent developments in the spring-controlled valve have reduced this wasted power to a minimum.

The tendency in design of spring-controlled valves has been in two directions, towards the finger type, and towards the annular plate type. In the finger type a number of thin strips of steel are held in position over the valve seat. In operation, the valve strips are lifted by the air pressure, and are returned to their seats by their own spring action. This type of valve is simple and has certain advantages, particularly for small compressors, but for the larger machines the annular plate valve is gaining ground. The pioneers in this field were Rogler and Hoerbiger in Austria, who after a long period of investigation and invention developed the Rogler valve. The patents on this continent are held by the American and Canadian Ingersoll-Rand Companies, and the valve is known as the "Ingersoll-Rogler" valve.

The valve itself consists of a ring shaped plate, "F" in the illustrations, held down on the valve seat and ports by the four coiled springs "J" and the slight tension of the thin flat spring "M." It should be mentioned here that the spring "M" is made in one piece with the valve, and as "M" is forced to rise and fall in the same position by the dowel pin "D," the valve must also reseat itself every time in exactly the same position. In this little feature lies one of the main points of superiority of the "Ingersoll-Rogler" valve, one which makes it so admirably fitted for high-speed work, for the main difficulty with plate valves has been to have them reseat every time in the same position. It can easily be seen that if the valve rotates ever so slightly each time wear is soon set up and the valve cannot remain tight and leakage results. This would happen with a plate type of valve where the flat spring

Parts of Ingersoll-Rogler Valve and Seat.

was not rigidly connected to the valve ring, for instance, if it were clipped or even rivetted to the valve. In the "Ingersoll-Rogler" valve the spring and valve are one piece and cannot rotate.

In operation, as soon as the required pressure is reached the valve rises at once against the coiled springs "J" to nearly its full opening, completing the last 1-32nd to 1-16th against the slight pressure of the buffer plate "H," which brings the valve gently to rest even at high speeds. Owing to the lightness of the valve, its action is very rapid, which gives the double advantage that the opening is prompt, and there is a minimum of inertia to overcome. This inertia factor becomes very important with a valve of the heavy spring type, where the spring not only requires a pressure in excess of the discharge pressure to open, but to keep it open. By experiment it has been found that an "Ingersoll-Rogler" valve requires, for opening, one-third of the pressure required by a valve of equal capacity of the heavy spring type, and two-thirds of the pressure to keep open during the stroke. This means that not only does the "Ingersoll-Rogler" valve reduce the "hump" to be found in the discharge line on the indicator card—and the larger the "hump" the greater the lost work—but it requires one-third less pressure to keep open,

Cross Section of Ingersoll-Rogler Valve.

the saving from this item amounting to 2.9% of the total power. Adding this gain in efficiency to the gain due to less pressure being needed to open the valve—at least 1% of the total power—it is seen that the "Ingersoll-Rogler" valve gives a gain in efficiency measured by actual test of 3.9%, not counting the other advantages of the valve. The design is so simple that there is absolutely nothing to go wrong. The only part that can wear out is the valve itself, which can be easily and cheaply replaced. The integral spring insures tightness, and after a few days the valve is absolutely tight on its seat. The design lends itself to convenience, the valves being placed where they are most accessible at the ends of the air cylinders. There they are best placed for short and straight air passages. The lift is remarkably small, varying from .08 in. to .14 in., hence the valve is silent and well adapted to the high speeds for which it is designed. The lift area equals the port area, and ample port area is provided.

To summarize, the advantages of the "Ingersoll-Rogler" air compressor valve are: The valve is light and requires little power to open and keep open; the lift being low, and the operation of the valve being cushioned, the valve is silent and has very little shock or wear; the valve opens quickly to its full extent, hence is particularly suited to high speed operation; there are no mechanical intricacies to add friction, and the valve does not need adjustment; finally the valve is easily accessible, and can be placed to the best advantage.

LOOKING FOR PLATINUM AND MERCURY IN BRITISH COLUMBIA.

The Dominion Government is turning its attention to the mineral resources of British Columbia for supplies urgently needed for war munitions. Within the last two weeks two members of the staff of the Canadian Mines Department have reached the Western Province on special missions. Dr. Victor Dalmage, assistant Geological Surveyor, is here to report upon two deposits containing mercury on the West Coast of Vancouver Island. Dr. E. Psitevin, Dominion Mineralogist, has come West to learn something more than existing reports give regarding the platinum occurrences of the placer districts of the Provincial interior. The former is in quest of claims located years ago and abandoned either because at that time mercury was not sufficiently valuable to make them worth while or owing to lack of capital. Conditions now, however, are very different and Dr. Dalmage and party will spend the summer thoroughly prospecting the coast of Vancouver Island from Quatsino Sound south. Incidentally he will examine and report on certain copper properties. Besides making a search for platinum in commercial quantities, Dr. Psitevin will go into the matter of British Columbia's resources in chromite.

The announcement of an advance in the selling price of coal in British Columbia is momentarily looked for. That an application to the Fuel Controller for sanction for such a course was expected following the latest increase of 50 cents a day granted the coal miners. It is predicted that the increase will be between 50 and 65 cents per ton.

The Gowganda area has, from the time of the first discovery of silver there, suffered from lack of transportation facilities. It is not surprising that considerable dissatisfaction has been expressed by those who have attempted to develop properties there.

PERSONAL

Mr. D. A. Dunlap, of Toronto, succeeds the late John McMartin as vice-president of Hollinger Consolidated. Dr. W. L. McDougald of Montreal, has been elected a member of the board of directors.

Major W. A. Mensch, E.M., president of the Telluride Chief Extension Mining Company, of San Diego, Cal., is visiting the Kirkland Lake Camp.

Mr. F. C. Worth, of the Three Star Mining Company, now operating the former Calumet and Montana property at Cobalt, is in Chicago. He will return in about two weeks.

Mr. S. Harry Worth, of Philadelphia, president of the Elliot-Kirkland and the Seneca-Superior mine at Cobalt, visited the Elliot-Kirkland and a number of other properties in the Kirkland Lake camp recently.

Sergt. R. Douglas Gregory, who was recently discharged from the Overseas Forces, is now on the engineering staff of the British American Nickel Co.

Mr. J. B. Tyrrell is in British Columbia.

Mr. H. M. Lamb, secretary of the Canadian Mining Institute is in British Columbia.

Mr. W. A. Carlyle is now residing in Ottawa.

Dr. W. F. Ferrier was in Toronto last week. He will undertake further work for the Munitions Resources Commission.

The Vocational Branch of the Invalided Soldiers' Commission gave a dinner at the Engineers' Club, Toronto, on June 4th, under the auspices of the Engineers of Toronto, to thirty American visitors sent by the United States Government to study the Canadian methods of re-educating the returned soldier. The work being done by the Commission was explained by Mr. W. E. Segsworth, who is in charge of the Vocational Branch. Mr. H. E. T. Haultain, Vocational Officer for Ontario, presided.

Mr. T. R. Deaville, Fuel Controller in Manitoba, is quoted as accusing the coal mine operators of British Columbia, Alberta and Saskatchewan as being strangely lacking in business sense and a spirit of co-operation in not starting a campaign with a view to explaining to the people of the Province of Manitoba the quality of the coal of the Western Provinces and giving directions as to the best methods of handling and burning it. He added: "If Winnipeg people get the proper kind of Western coal, and if it turns out that they can get no other, I'm convinced that there will be no serious hardship as a result."

The Granby Consolidated Mining & Smelting Corporation in the course of developing its newly acquired coal bearing areas near Nanaimo, B.C., has driven three slopes. On one, at a depth of 150 ft., a seam, fourteen feet at that point, has been opened up. The management express themselves as satisfied with the results up to date.

Mr. A. H. Curtis, of New York, and Mr. G. C. Miller, of Buffalo, have been chosen directors to succeed Mr. J. S. Wilson and Mr. A. S. Wigmore. The other directors of Dome Extension are W. S. Edwards, Alex. Fasken and J. S. Tomesson.

Mr. W. B. Royce, President of the National Surety Co., of New York, has been elected director of Dome Mines company, succeeding Mr. J. S. Wilson.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.

Pittsburg-Lorrain.

The ball mill for the Pittsburg-Lorrain Mining Company in South Lorraine, which was manufactured at the Wabi Iron Works, New Liskeard, was shipped to the property about a week ago. An improvement in the tonnage treated at the mill and also in the percentage of extraction is expected to result from the finer grinding made possible by this installation. The advent of successful manufacture of mining machinery at New Liskeard is of great importance to the mining industry of Northern Ontario, owing to the fact that delays in shipment of equipment of all kinds from the south have been very inconvenient of late.

Dividends Declared.

The Mining Corporation of Canada has declared a dividend of 12½ cents together with a bonus of 6¼ cents per share, payable on June 15th to shareholders of record June 1st.

McKinley-Darragh directors have declared the regular dividend of three per cent. payable on the first day of July to shareholders on record at the close of business on June 8th.

Hollinger directors have declared a dividend of one per cent. payable June 17th.

Shortage of Labor.

So keenly is the labor shortage being felt in the prospecting field this season, that claim holders are finding it difficult to secure enough men to even perform their assessment work. A number of contractors for this class of work are refusing orders on this account. The passing of an order-in-council by the Ontario Bureau of Mines recently that where two periods of work fall due in one year, the second period would be extended one year, met with the unanimous approval of the entire prospecting fraternity of the north.

Installing Groch Machines.

Changes now being effected in the mill of the Mining Corporation of Canada will provide for the treatment of about 300 tons of tailings per day, by the oil flotation process, and the plant will gradually be brought up to a capacity of 600 tons per day. Two Groch flotation machines, with a capacity of about 100-tons per day are to be installed at once in addition to the present equipment. It has been decided that the slimes of previous milling operations can be treated by cyanide better than by flotation. The method to be employed will be to pump the slimes from the bed of Cobalt Lake (where it is estimated about half a million tons of slimes and tailings have been deposited from the operations of the mill) to classifiers. Thence the slimes will go to the cyanide portion of the mill, while the sands, after being run through the tube mills, will go over the concentrating tables and then be treated by the Groch Centrifugal Flotation system. The pump being installed will have a capacity of 1,000 tons per day, the excess supply of material will be piled near the mill for convenience of handling in the winter months.

Work Resumed at Genesee.

After slight delay in operations at the lower levels of the Genesee property, owing to water troubles, work is again under way. Added pumping equipment to meet all emergencies has been installed. Work of exploring the fault zone in which ruby silver was discovered a short time ago is now under way. The operation is attracting more than ordinary interest.

Casey Cobalt is Again a Steady Producer.

The production of silver from the Casey Cobalt Mine is going ahead steadily since the rebuilding of the new mill, which replaced the one destroyed in the disastrous bush fires of 1916. The present plant has a battery of 20 stamps, whereas the old mill contained 30 stamps. During the period which the property was without milling facilities, underground work was not carried on very aggressively. Now, however, with the new mill completed and running to capacity, a resumption of the remarkable record established prior to the fire is looked for. The price of silver having advanced greatly since the suspension of operations at the property two years ago, the value of the mine has been enhanced thereby.

Ore Shipments.

During the month of April the ore shipments over the T. & N. O. Ry. were as follows:

Silver Ore.	
Cobalt.	Tons.
Beaver	36.23
Buffalo	296.69
Coniagas	162.05
Dominion Reduction Co.	141.50
Kerr Lake	59.84
Larose	64.36
McKinley-Darragh	149.22
Nipissing	230.19
O'Brien	32.32
Right of Way	41.98
Trethewey	82.32
Total	1,296.70

The Alexo Mining Company shipped 544.60 tons of Nickel ore from Porquois Junction.

The lowest price of silver during the month of April was on the 8th of the month, 91.38 being quoted; while the high for the month was the 25th at 99.75 cents per ounce. Average price for month was 95.345.

Rapid Development of Elliott-Kirkland.

The crosscut at the 500-foot level of the Elliott-Kirkland property at Kirkland Lake has cut the vein. The development of the Elliott-Kirkland is one of the outstanding achievements of the Kirkland Lake Camp. At the time the property was taken under option by the present owners, the latter part of 1916, nothing but surface trenching had been done. The following January sinking was commenced by hand steel and by April of the same year the mining plant had been installed and work was under way on an aggressive scale. Since that time the shaft has been carried to a depth of 500 ft. and upwards of 600 ft. of lateral work has been done. A new hoist, 9 x 12, has just been completed which will be sufficiently powerful to see the mine through its development stage. It is anticipated that a central shaft will be sunk on the property about 700 ft. west south-west from the present working shaft. At this point there is an elevation of land which will probably be chosen as the site for a mill when this becomes necessary. The Elliott-Kirkland is controlled by the interests formerly connected with the rich Seneca Superior Mine at Cobalt, and is under the management of Mr. Robert Lyman, who was also manager of the latter property. A number of the directors visited the property last week and were highly pleased with developments to date.

Good Results at Lake Shore Gold Mine.

In his report to the president and directors of the Lake Shore mine at Kirkland Lake, Mr. R. C. Coffee, manager, stated that the mine produced gold bullion estimated at \$66,696, of which \$24,606 was the March output. The mill treated 1,050 tons in March, and 1,520 tons in April. Since starting on March 8th, the mill has run 97.21 per cent. of the possible running time. Underground developments consisted of drifting and raising on the No. 1 vein and drifting on the 200 and 400 foot levels of the No. 2 vein. A special feature of the report is the fact that from the day the mill was started there has been no loss of time, the mill having run 97.21 per cent. of the possible running time, and a number of the interruptions to operation were caused by failure of the electric transmission line which supplies the camp. A little over 50 tons per day was treated during April, which shows the mill heads to have averaged approximately \$27.70 per ton. The Lake Shore is now the third largest producing gold mine in the Dominion of Canada. In their order of production at present these mines are: Hollinger Consolidated, McIntyre-Porcupine, Lake Shore and Tough-Oakes. In addition to the present record, the property is developing in such a way as to make it necessary to add to the grinding equipment before long, which will thus add from 50 to 100 per cent. to the tonnage treated. The cyanide end of the mill now has a capacity of from 100 to 125 tons per day.

A Second Strike Made at Burnside Mine.

A second important strike of rich ore has been made on the Burnside property at Kirkland Lake within the past two weeks. The first strike was a five-foot vein in a new shaft several hundred feet west of the number two shaft, in which the most recent strike was made. The vein encountered in the first strike is five feet wide and several inches of the vein matter is very rich while the whole five feet is of a good commercial grade. The last strike was made at a depth of 160 feet in a crosscut at the Number two shaft and in the last round of shots some two feet of ore was broken into with the face of the crosscut still in good ore. The Burnside is controlled by the Aladdin-Cobalt Mining Company of Cobalt and the Sylvanite plant is being used for the development of the property.

Kirkland Porphyry.

The downward continuation of the orebody at the Orr Gold Mines at Kirkland Lake, now under option to the Kirkland Porphyry, has been encountered at a depth of 400 feet, and contains ten feet of \$20 ore, with 15 to 20 feet of low grade, the vein being about 30 to 35 feet in width. The ore is said to bear the same characteristics as that encountered on the upper levels. The finding of the vein at this depth on the Orr was almost a foregone conclusion, owing to the fact that it had been developed on the Teck-Hughes to the north-east to a depth of 600 feet and on the Kirkland Lake Gold mines on the west to a depth of 700 feet. It is nevertheless gratifying to prove its existence at another point. The dip of the vein is to the south and for this reason each succeeding level opened upon the Orr is steadily increasing the possible tonnage available. There is also excellent possibilities of the Orr picking up the extension of the south vein system of the neighboring Lake Shore mine, which has a trend in the direction of the Orr.

Mining Molybdenite Near Amos, Que.

Three local mining engineers, Messrs. Balmer Neilly, Lewis Ledyard, and W. E. Simpson, have just returned

from a trip to Lake Keewagama, near Amos, Que., where they visited the molybdenum mines controlled by the Indian Peninsula Mining Company, Limited. Mr. Ledyard has accepted the position of mining engineer at the Indian Peninsula and will have charge of the mining development work, while Mr. W. E. Simpson, one of the directors of the company, will have charge of the metallurgical work. The first car load of supplies for the property is being assembled at Cobalt and will soon be shipped to the property. A 100-ton oil flotation plant of the Groch Centrifugal System is being installed.

Resuming Work at Kirkland Lake Gold Mine.
